NVIDIA video script

The NVIDIA video: everything you need

1. Title (pick one)

1. **NVIDIA's Chart Broke Before the Scandal. Then a Memecoin About It Went 100x.** (recommended, matches thumbnail C)
2. How to Short NVIDIA AND Catch the $9K → $1M Scandal Coin
3. The Chart Knew First: NVIDIA, a CEO Scandal, and a $1M Memecoin

2. Thumbnail

- **Use:** `thumbnail_C_face.png` (SELL THE STOCK / BUY THE SCANDAL).
- **A/B test it against:** `thumbnail_D_face.png` (THE CHART KNEW / THE COIN 100X'D).
- `thumbnail_A.png` and `thumbnail_B.png` are the same two designs without your face, if you ever want them.

3. Before you hit record

- Have these four charts open, full screen, in this order:
  - `1_NVDA_PRNTR_box.png`
  - `4_NVDA_1h_turn_and_coins.png`
  - `2_NVDA_vs_HUNG.png`
  - `3_timeline_news_vs_coins.png`

- Have DEX Screener and Pump.fun open in a browser tab, for the search part.
- Lines in **[brackets]** are directions for you or your editor. Don't read them out loud.
- Everything else, say it exactly as written. Contractions on purpose. Talk like you're explaining it to a friend at dinner, not reading the news.
- Speak a bit faster than feels natural. It plays back normal.

---

4. The script

HOOK (0:00)

[FACE. Close up. No intro music. Start talking the second it starts.]

Three days before the NVIDIA scandal hit the news, the chart was already screaming "get out."

And while the whole internet was arguing about Jensen Huang's personal life, a memecoin about it went from nine thousand dollars to a million dollars. In two hours.

Most people saw one of those things. Today I'm going to show you both of them, on the same clock, at the same time. And how you could've traded both.

I've genuinely never seen anybody break a trade down like this, so stick with me, because the last part is the part nobody talks about.

[Quick cut. Thumbnail-style title card for one second: "SELL THE STOCK. BUY THE SCANDAL."]

WHO I AM (0:25)

[FACE]

If you're new here: I'm [your name]. I used to be a doctor. Then I took seven thousand dollars and turned it into over a million trading. So yes, my mom is still confused about my career choices.

I trade two things. Charts, with a system I built called PRNTR. And memecoins.

Most people pick one. Today I'm combining them, and I call this the **PRNTR Crossover**.

PART 1: THE BOX (0:50)

[CHART 1 on screen: `1_NVDA_PRNTR_box.png`. Use your cursor to trace each part as you say it.]

Okay. This is NVIDIA on the daily chart. The most talked-about stock on the planet.

From October last year, price was basically stuck in a **Box**. A ceiling up around two hundred and twelve dollars. A floor down around a hundred and sixty-eight. And the middle, right around a hundred and ninety.

Every time it got to the top, it got sold. Every time it got to the bottom, it got bought. Like a ping-pong ball. Very expensive ping-pong.

Now, here's where it gets interesting.

[Point at the May high.]

In May, price broke out above the ceiling. Everybody on Twitter: “NVIDIA to the moon!” And then it fell right back in.

[Point at the October 6th high.]

October 6th, it does it again. Breaks out, all the way to two forty-three. A new high. And again, it falls right back in.

That’s what I call a **Fake-Out**. It looks like a breakout. It’s built to look like a breakout. And the only thing it actually does is trap everybody who bought the breakout.

Two Fake-Outs. Two groups of trapped buyers.

[Point at October 30th.]

By October 30th, price is back inside the Box. I call that **the Return**.

[Point at November 5th.]

And on November 5th, NVIDIA closes at a hundred and eighty-one sixty. Below the middle of the Box.

That’s **the Turn**. That’s the moment the chart says: the buyers are done defending this thing, and the trip to the floor is on.

Now remember the date. November 5th.

The scandal didn’t go public until November 8th.

[FACE, lean in.]

The chart didn’t know about any scandal. Charts don’t read the New York Times. Charts can’t read. But the chart could see that the people

with the most money had already stopped buying. And that's all you need.

PART 2: ZOOM IN, THE ONE-HOUR TURN (2:45)

[CHART 4 on screen: `4_NVDA_1h_turn_and_coins.png`. Top panel first.]

Now, the daily chart is great, but it's slow. If you waited for the daily Turn, you got in at a hundred and eighty-one.

So let's zoom in to the one-hour chart. And this is where it gets good.

From October 30th to November 4th, NVIDIA built a **small Box** inside the big one. Floor at two hundred and one thirty-two. Ceiling at two-ten twenty-eight.

[Point at the two Fake-Outs at the top.]

Look at the top. November 3rd, it pokes above the ceiling, two eleven twenty-six. Sold straight back in. November 4th, it pokes above again, two eleven thirty-five. Sold straight back in.

Same story as the daily chart, just smaller. Two Fake-Outs. Big money is selling every single pop to the people buying breakouts.

[Point at the red Turn label.]

Then November 4th, around four p.m. New York time, an hourly candle closes **below** the floor of the small Box. Two hundred dollars and sixty-three cents.

That's the Turn on the one-hour chart. That's the sell.

Here's the plan, plain and simple:

- **Sell** at two hundred dollars and sixty-three cents.
- **Stop** at two-oh-seven thirty, just above the last bounce that failed inside the Box. If price gets back up there, I'm wrong, I'm out, no drama.
- **Target**: a hundred and sixty-eight. The floor of the **big** Box.

And that's a low target on purpose. When a small Box breaks, inside a big Box that's already turned, price usually doesn't stop halfway. It goes all the way across.

[Point at the green zone, then the target hit.]

So what happened?

After the entry, the highest NVIDIA ever got was two-oh-two twenty-five. It never even came close to the stop.

And on November 10th, it hit a hundred and sixty-eight. Target.

That's almost **five times** what you risked.

To put real numbers on it, just as an example: a thousand dollars at five times leverage makes about eight hundred and thirteen dollars on this one trade. And if you were wrong, the stop costs you about a hundred and sixty-six.

Risk a hundred and sixty-six to make eight hundred. I'll take that trade every day of the week and twice on Sunday.

[FACE]

Quick, honest note: I marked this chart up by hand, after the fact, with my rules. I'm showing you how to see it. I'm not telling you I sat there

and nailed the exact top. Nobody's that good. Except in YouTube comments.

PART 3: THE NEWS (5:15)

[FACE. Slower. More serious.]

Okay. Now the news.

And I'm going to say this carefully, because these are real people: everything I'm about to say is **as reported** by the press.

On November 8th, according to multiple reports, Jensen Huang sent an email to NVIDIA staff saying he'd been unfaithful to his wife.

More reports came out after that, including allegations, and they are just allegations, involving a suspected Chinese spy.

By November 11th and 12th, he'd resigned as CEO, and Congress wanted him to testify.

Now, the average person sees that headline and goes, "Oh, THAT'S why NVIDIA dropped."

[Beat.]

No. NVIDIA had already turned. The news just told everybody else why.

[Back to CHART 4, point at the dashed purple line on November 8th.]

And here's a crazy detail. November 8th was a Sunday. The stock market was closed. But NVIDIA trades twenty-four seven as a perpetual on crypto exchanges, and look at this candle. When the news broke, it

dropped from a hundred eighty-seven eighty-eight to a hundred and eighty sixty-seven. In one hour. On a Sunday.

If you were already short from November 4th, you were sitting on the couch watching that happen with a smile on your face.

PART 4: THE MEMECOIN (6:45)

[CHART 2 on screen: `2_NVDA_vs_HUNG.png`. Point at the bottom panel.]

Now here's where the second world comes in. Memecoins.

Within hours of a story like this, people make coins about it on Pump.fun. Because the internet doesn't sleep. It just makes tickers.

This one is called "Jensen Hung." The ticker is HUNG.

[Beat. Look at camera.]

Yeah. I didn't name it. Please don't email me.

On November 9th, the day after the email, HUNG was trading at about forty-four thousand dollars in market cap.

And then it faded. For about two days, it sat around nine or ten thousand dollars. Most people gave up on it. If you bought it at forty-four K on day one, congratulations, you got to watch it lose eighty percent. Very character building.

[Point at the vertical line on November 11th.]

And then, on the evening of November 11th, the resignation news hit.

In about two hours, HUNG went from around nine thousand seven hundred dollars to almost **one million dollars**.

The next day it touched about a million two-ninety. That was the top.

[Point at the top panel, then the bottom panel.]

Look at these two charts together. NVIDIA's worst news was this coin's best day.

PART 5: BOTH TRADES, ONE STORY (8:15)

[CHART 4 again. This is the money part, take your time.]

Okay. Now let me put both worlds together, step by step. This is the part I've never seen anyone do.

[Point at each moment on the chart as you say it. Top panel for NVIDIA, bottom for the coins.]

November 4th. The one-hour Turn. I sell NVIDIA at two hundred dollars and sixty-three cents.

And look at the bottom of the chart. There is **no scandal coin**. Nothing. There's nothing to buy yet. So what do I do? I set alerts on every name in the story so far. On October 29th, the New York Times had already reported a close relationship with an executive named Alice Huang, from a company called Megaspeed. So those names go on my list.

November 7th. The Financial Times reports an intelligence memo. That same morning, somebody makes a coin called "The NVIDIA Files" at about thirty-seven hundred dollars. I'd put a few dollars in, max. And good thing, because it only made it to about seventeen thousand.

November 8th. The email. NVIDIA drops almost four percent in an hour, on a Sunday. I'm searching "Huang," "Jensen," "Hung," on Pump.fun and on FOMO.

November 9th. HUNG shows up at forty-four thousand. I don't chase it. I just watch it.

November 10th. NVIDIA hits a hundred and sixty-eight. I close the short. Almost five times my risk.

[Point at the green shaded zone in the bottom panel.]

And look at the bottom panel. Same day. HUNG is **under ten thousand dollars**. It sat under ten K for about thirty hours, as low as seventy-eight hundred.

So I take a small slice of my NVIDIA profit, and I buy HUNG.

November 11th. The resignation hits. Nine thousand seven hundred to almost a million. And I sell in pieces, between six hundred and eight hundred thousand.

[FACE]

Let's do the math on that.

A thousand dollars at five times on the NVIDIA short makes about eight hundred and thirteen.

Take fifty bucks of that. Just fifty. Buy HUNG at around nine thousand. That's about half a percent of the whole coin.

Sell it at seven hundred thousand, and that fifty dollars is about **thirty-nine hundred dollars**.

The short paid for the coin. The coin paid for the vacation.

[Beat.]

Now, real talk, because I don't want anybody getting hurt:

- While HUNG was quiet, it only traded fifty to a hundred and sixty dollars an hour. That's tiny. So you buy small, or you'll move the price yourself.
- Nobody sells the exact top. Selling the top is like a unicorn. Everybody talks about it, nobody's actually seen one.
- And for every HUNG, there are dozens of coins that go straight to zero. So you only ever put in money you're completely fine losing.

And if you'd rather use a **put option** on NVIDIA instead of a short, same idea. It makes money when NVIDIA falls, and the most you can lose is what you paid for it. You just pick the strike and the expiry yourself. The numbers I gave you were for the short.

PART 6: COULD YOU HAVE SEEN IT COMING? (11:00)

[CHART 3 on screen: `3_timeline_news_vs_coins.png`.]

Now the question everybody asks: "Okay, but how would I know the news was coming?"

You don't need to know the future. You just need to notice that this story didn't drop in one day. It leaked out in pieces, for two weeks.

[Point at each line.]

- October 29th: the first New York Times report. An "Alice Huang" coin got made the same day. It never took off.

- November 7th: the Financial Times report. “The NVIDIA Files” coin.
- November 8th: the email.
- November 11th and 12th: the resignation. That’s when HUNG ran.

Every one of those headlines was a chance to be early.

And the cheapest moment wasn’t the first headline. It was the **quiet** in between. When everybody got bored and moved on.

PART 7: HOW TO FIND THE COIN (12:00)

[SCREEN: DEX Screener and Pump.fun. Type “HUNG”, then “JENSEN”.]

Let me show you how this looks live.

When I search “HUNG,” look how many coins come up. There’s even one from back in June, sitting under two thousand dollars. It was first by date, and it went absolutely nowhere.

So the rule isn’t “buy the oldest one.” The rule is: when the story breaks, find the first coin that gets **real volume and real holders**. And make sure it isn’t a scam.

[Type “JENSEN”.]

Now search “JENSEN.” Dozens of copies made in the last few days. Most of them sitting at two to five thousand dollars. That’s what most of these become.

One winner. A pile of losers. That’s why you size small.

PART 8: THE PRNTR CROSSOVER IN FIVE STEPS (12:45)

[FACE. Count on your fingers.]

So here's the whole thing, in five steps. Screenshot this.

One. Watch the big names with PRNTR. When one makes its Turn, it goes on your list. Drop to the one-hour chart for the entry, and aim for the floor of the big Box.

Two. Watch that company's news like a hawk. A chart that's already weak, plus a big headline, gives you the biggest moves.

Three. Set alerts on the names. The person, the nickname, every person and company in the story. And the same hour a new name shows up, search it on Pump.fun and FOMO.

Four. Pick the coin with real volume, not just the oldest. Make sure it's not a scam. Buy small. Ideally in the quiet between headlines.

Five. Sell into the second headline. HUNG didn't move on the first story. It moved on the resignation. That's when everybody shows up, and that's when you leave.

THE CLOSE (13:45)

[FACE. Relaxed. This is a conversation, not a sales pitch.]

Now. I'll be honest with you.

Doing all of this by hand is a lot. Watching hundreds of charts, waiting for the Turn, checking the stop and the target. That's a full-time job. I know, because it used to be mine.

So I built a system that does the chart side for me.

It scans hundreds of markets around the clock. Crypto, and stocks like NVIDIA. When a PRNTR setup actually confirms, the entry, the stop and the target come straight to your phone. You don't have to sit there staring at charts. You don't have to draw a single box.

And on the memecoin side, I show you how to set up your alerts and your copy-trading, so a lot of that runs on its own too.

That system, plus me, one-on-one, for ninety days, is what my mentorship is.

We go through the PRNTR charts. The memecoin side. And how to move money from one into the other, like I just showed you.

If you want in, the link's in the description. Spots are limited, because it's actually me on the other end.

And if you want to see every Grade A setup the system has flagged, wins and losses, that's on the website too. I don't hide the losers.

[Beat. Smile.]

If this video blew your mind even a little bit, hit like, subscribe, and comment "CROSSOVER" so I know you made it to the end. I read those.

None of this is financial advice. Memecoins are extremely risky, most go to zero, and the numbers in this video are what the market did, not what you should expect.

Trade safe. I'll see you in the next one.

[END. Hold eye contact for one second, then cut.]

---

5. Description (paste this)

> NVIDIA's chart turned three days before the scandal went public. And a memecoin about it went from about $9K to $1M in two hours. In this video I show both on the same clock, and how you could have traded both: short NVIDIA from the 1-hour chart, then use part of the profit to buy the coin in the quiet before the second headline.
