PRNTR

THE CROSSOVER AND CRYPTO INCOME BOOK

Read a big stock's chart, trade the memecoin wave its news creates, front-run every narrative on the calendar, and build income in crypto that doesn't need a single trade.

Part of the PRNTR 1-on-1 Mentorship. 13 real case studies with real prices. Education only, not financial advice.

START HERE

What's in this book

Part A · The PRNTR Crossover
How stock news creates memecoins, the PRNTR Box on the daily and weekly chart, the two models, and the four kinds of stock-and-coin pairs.

Part B · 13 real case studies
NVIDIA, GameStop, AMC, Tesla, Trump Media, Netflix, Pop Mart, Oracle. Real candles, real coin numbers, sources, and honest $10 math.

Part C · Front-running everything
Narratives, the calendar, the OG coin, supply math, traders who front-run, news and celebrity watch lists, animal and culture metas.

Part D · Income without trading
Become a caller, build a Telegram network, launch coins as a developer, grow on X and get paid by X, earn token supply, sell Telegram usernames.

Part E · Rules, law and your plan
What gets people sued or charged, taxes, the 90-day plan, checklists, glossary and every source.

How to use it
Read Part A once. Study one case a day. Use Part C every week. Pick one or two income paths from Part D and run the 90-day plan.

THE HONEST WARNING

Read this before you start

Most

memecoins go to zero. Solidus Labs found 98.6% of Pump.fun tokens showed scam or pump-and-dump traits.

Top ≠ you

The case numbers show what was possible at the top. Nobody sells the exact top, so we show a realistic exit too.

1–2%

The most you risk on any one trade. Small bets are what let you survive the zeros.

- Every price and market cap in this book comes from a named source. Where a figure is our own estimate, it says so.
- Copies of every famous coin exist. Never buy from a contract address you didn't check yourself.
- Paid promotion, front-running your own followers and rug pulls are illegal in many places. Part E covers what's allowed.

01

The PRNTR Crossover

Big stocks and memecoins run on the same thing: attention. When a stock's story hits the news, the crowd goes looking for a coin with that story's name. The stock chart often tells you first.

CHAPTER 1

The idea in one slide

1

The stock coils

A big name trades sideways in a Box on the daily or weekly chart for weeks or months.

2

The news lands

Earnings, a launch, an election, a celebrity post, a shock. Everyone talks about one name.

3

The crowd searches

People type that name, the person or the cause into Pump.fun, FOMO and DEX Screener.

4

The coin runs

The coin with the name the crowd types can go 10x, 100x or more in hours or days.

5

You sell into it

You take profit while attention peaks, and move it into the money loop.

The stock chart is the clock. The memecoin is the lottery ticket on the same story. PRNTR trades both, small and in order.

CHAPTER 1

Why stocks and memecoins move together

Same headline, two markets
When NVIDIA, Tesla or GameStop is the story of the day, the same headline is on X, Telegram and every news app at once.

The crowd searches the name
New buyers search the company, the product, the person or the cause on Pump.fun. A coin with that name gets bought.

Coins move faster
A stock might move 10–20% on big news. A small coin on the same story can move 1,000% in an afternoon, both ways.

Stocks keep hours, coins never close
Stock news often lands after the close or on weekends. The coin trades it first. Monday's open on the stock can be the second wave.

CHAPTER 1

What the Crossover is, and isn't

It is

A way to see a story coming on a big chart

A list of names to search before the crowd does

A reason to take a small coin trade with a plan

A way to let a stock trade pay for the coin trade

It isn't

A promise that every stock move has a coin

A reason to buy any coin with a famous name

A way to get rich on one trade

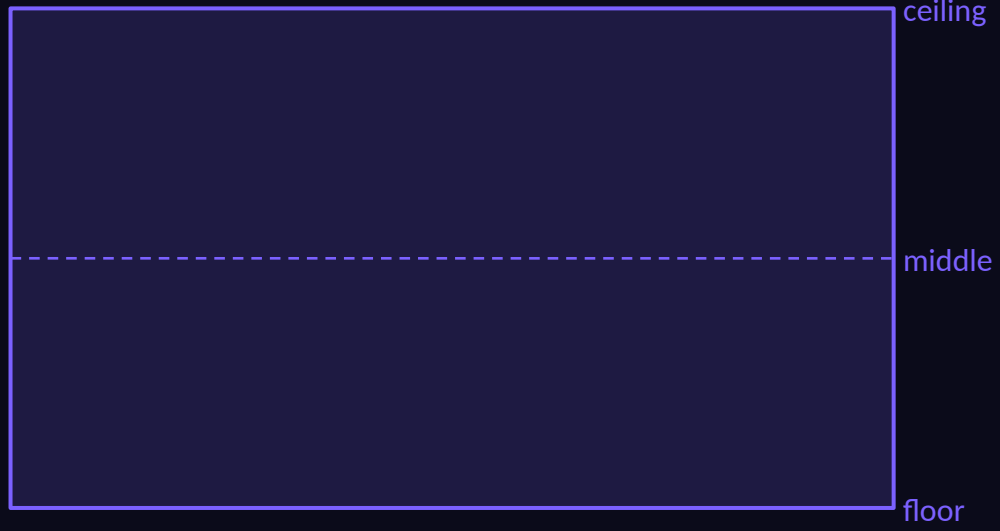

An excuse to skip the safety check or the size rules

02

The PRNTR chart, on the higher timeframe

The Box, the Fake-Out, the Return, the Turn, the trip across and the Launch Pad. Read them on the weekly and daily chart to see the big story; use the 1-hour for timing.

The Box

Ceiling
The highest close of the sideways stretch.

Floor
The lowest close.

Middle
Halfway. Price around the middle is noise: no trade.

Why closes
Wicks poke out all the time. A close tells you where the market agreed on price. Every Box in this book is drawn from real closes.

CHAPTER 2

The Fake-Out, the Return and the trip across

1

Fake-Out

Price pokes beyond the ceiling or floor and grabs the stop-losses there.

2

The Return

Price closes back inside the Box. The breakout buyers are trapped.

3

The Turn

On a lower timeframe, the chart turns back the other way. That's your entry.

4

The trip across

Price travels to the other side of the Box. The far side is the first target.

No Return, no trade. If price pokes out and keeps going, that wasn't a Fake-Out, it was a real move.

CHAPTER 2

The Launch Pad

What it is

A Box that has already done its Fake-Out and Return on one side, then closes out of the other side. The Box becomes the pad the big move launches from.

Why it matters for coins

On a big stock, the launch usually comes with news. The day the stock closes out of a months-long Box is the day its story is everywhere, and the coins with its name get searched.

A launch that closes back inside the Box within a few days failed. Treat it like a Fake-Out on that side, and expect the trip across.

CHAPTER 2

The two models

The up model

1. Fake-Out below the floor
2. The Return: back inside
3. The Turn up on the 1-hour
4. The trip across to the ceiling
5. Close above the ceiling: launch up

Stock examples: Tesla Nov 2024, NVIDIA Feb 2024, Pop Mart 2025

The down model

1. Fake-Out above the ceiling
2. The Return: back inside
3. The Turn down on the 1-hour
4. The trip across to the floor
5. Close below the floor: launch down

Stock examples: NVIDIA Jan 2025 (DeepSeek), NVIDIA Nov 2026

The Fake-Out tells you which side the market is fishing on. The launch usually goes the other way.

Why the higher timeframe

Timeframe	What it tells you	Use it for
Weekly	The big story: months in a Box, the year's ceiling and floor	Which side the big move is likely to go
Daily	The Fake-Outs, the Return, the launch close	The level that matters and the date it breaks
4-hour	How price reacts around the news	Planning the stop and the target
1-hour	The Turn	Your entry, with a tight stop

Weekly and daily tell you what. The 1-hour tells you when. The coin trade happens on the news clock, minutes and hours.

CHAPTER 2

A higher-timeframe Box: Tesla, weekly

Real weekly candles. A Box from January to October 2024, then the election week closed above the ceiling ($269.19).

03

How a stock story becomes a coin

Four ways a stock and a memecoin pair up. Learn to name the type before you trade it, because each one has a different exit.

CHAPTER 3

From headline to coin, in minutes

Headline
News accounts, earnings, a post

›

X and Telegram
The name trends

›

Pump.fun
Coins with the name appear within minutes

›

Search
The crowd types the name on FOMO, Pump.fun, DEX Screener

›

Trending
One coin gets the volume and the holders

Speed decides who gets paid. Official TRUMP went from launch to about $1.2B in roughly 30 minutes. The 'NVDA AI' coin was created minutes after NVIDIA's earnings.

CHAPTER 3

The four kinds of pair

1 · Same way
Stock launches up, the coin with its name runs too. GameStop and GME/KITTY, Tesla and D.O.G.E., Pop Mart and LABUBU, NVIDIA earnings and 'NVDA AI'.

2 · Opposite way
The stock falls, and the coin named after the CAUSE of the fall runs. NVIDIA and the DeepSeek coin, Tesla and America Party, NVIDIA and HUNG.

3 · Sell the news
Stock and coin both rise into a dated event and both dump on it. Trump Media and MAGA on election day, GameStop's June livestream, the inauguration.

4 · The trap
A coin rides a famous story but buyers can't sell, or it's a copy. SQUID during Squid Game, the 2024 Squid Game copies, fake 'official' tokens.

CHAPTER 3

The exit depends on the type

Type	When the coin usually peaks	PRNTR exit
Same way	During the stock's launch day or the day after	50% at 3x, rest into the second headline
Opposite way	The day the shock hits, often in hours	Sell into the first spike; the cause-coin rarely holds
Sell the news	The days BEFORE the event	Be out before the event itself
The trap	Never, for you	Don't buy. Run the safety check first

Most losses in event coins come from holding a type-3 coin through the event, hoping for more.

Before you trade a pair: the checklist

- Is the stock in a Box on the daily or weekly chart? Where are the ceiling, floor and middle?
- Was there a Fake-Out on one side? Which way does that point the launch?
- Is there a dated catalyst? Earnings, a launch event, an election, a court date, a premiere, a vote.
- Which pair type is it? Same way, opposite way, sell the news, or a trap?
- Which names will people type? The ticker, the company, the product, the person, the cause, the nickname.
- Does an OG coin with that name already exist? When was it created, at what market cap, who holds it?
- Safety check passed? Can holders sell, is the creator holding a big share, is the supply bundled?
- Size: 1–2% of your trading money at most. Exit plan written before you buy.

04

Case studies: same way

The stock launches out of its Box and the coin with its name runs with it.

GameStop, May 2024: the Box

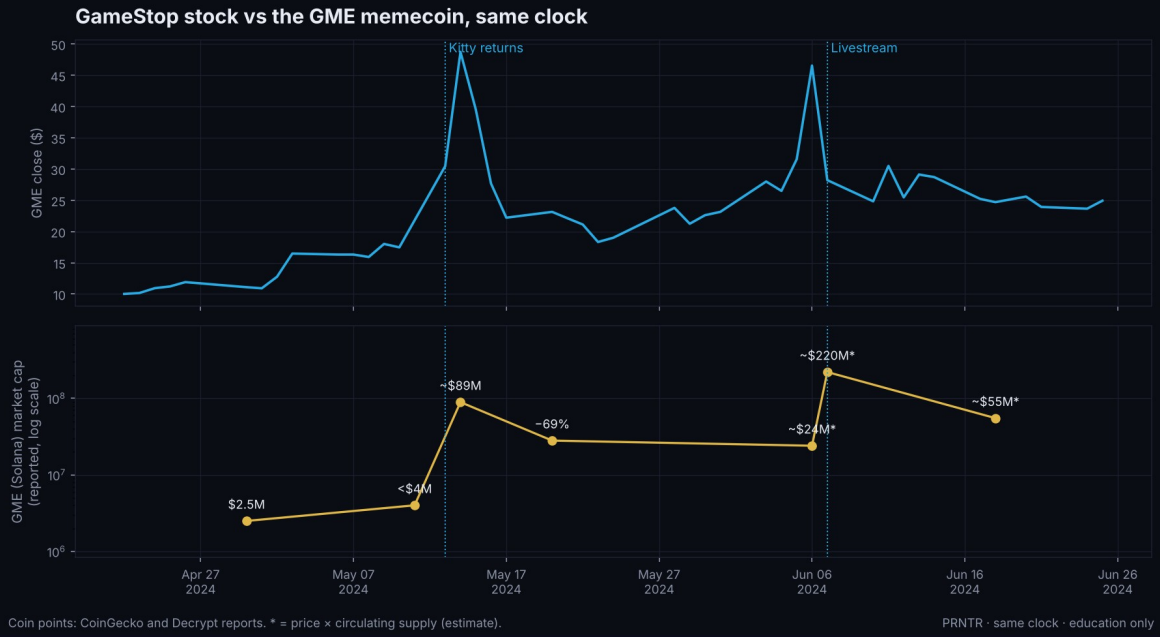

The Box
Mar 20 to May 10, 2024. Ceiling $18.01, floor $10.01 (closes).

Fake-Out
May 10: a wick to $20.20, closed back inside.

Launch up
Mon May 13: Roaring Kitty posts for the first time in 3 years. Closed $30.45 (+74%).

The top
May 14: high $64.83, then a close of $48.75. Trading was halted several times.

GameStop, May 2024: the coins

GME (Solana)
Fair launch Jan 28, 2024. $2.5M on Apr 30, under $4M on May 11, about $89M on May 14 (Decrypt). Down 69% within days.

KITTY (Solana)
Launched in March and left for dead. Up 13,000%+ within hours of the post, to about $40M. $19.3M by May 14.

Lesson
The ticker coin and the person coin both ran. The smaller one ran harder.

CASE 1 · GME × GME / KITTY

GameStop, May 2024: the $10 math

Coin	Bought at	Top	$10 at the top	PRNTR exit*
GME (Solana)	<$4M (May 11)	~$89M	~$220	~$70
KITTY	near zero	+13,000%	~$1,310	~$342

- Both coins existed for weeks or months before the post. The names were obvious to search: the ticker, and the man's nickname.
- Could you have known the date? No. This one was a surprise. That's why the PRNTR way is to hold a few dollars in the OG of every big name, waiting.
- The stock: a $1,000 long at the May 13 open was a coin flip on halts and gaps. The coin was the cleaner small bet.

** PRNTR exit = half sold at 3x, the other half sold at half the top multiple. Nobody sells the top.*

Tesla, election 2024: the Box

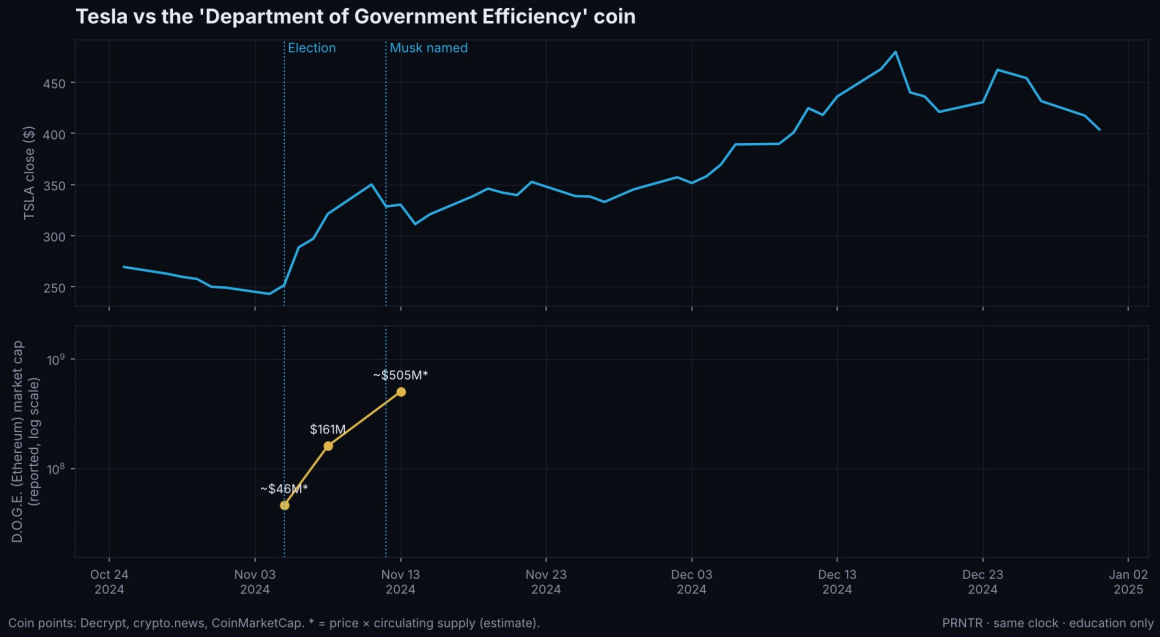

The Box
Aug 1 to Nov 5, 2024. Ceiling $269.19, floor $191.76.

Fake-Out
Aug 5: wick to $182.00 below the floor, closed back inside. The up model.

Launch up
Nov 6, the day after the election: closed $288.53 (+14.75%).

The run
High $488.54 on Dec 18: 81% above the ceiling.

Tesla vs the D.O.G.E. coin

The coin
'Department Of Government Efficiency' (Ethereum), made in Aug 2024 after Musk's posts about the idea.

The run
About $46M on election day (our estimate), $161M on Nov 8, about $505M at the Nov 13 top (estimate; crypto.news reported $342M that day).

Dogecoin
More than doubled to $0.43 by Nov 12, when Musk was named to the role.

Tesla × D.O.G.E.: what to learn

The weekly Box warned you
Ten months sideways, a Fake-Out below the floor in August, an election on the calendar. Coiled.

The name was public
Musk had talked about D.O.G.E. since August. The coin existed for 2.5 months before the election.

$10 math
~11x election day to top: $10 → about $110 at the top, about $42 with the PRNTR exit. Bought in August near launch, far more.

Second headline
The coin peaked on Nov 13, the day after Musk was named. The second headline was the sell.

Pop Mart, 2025: the Box

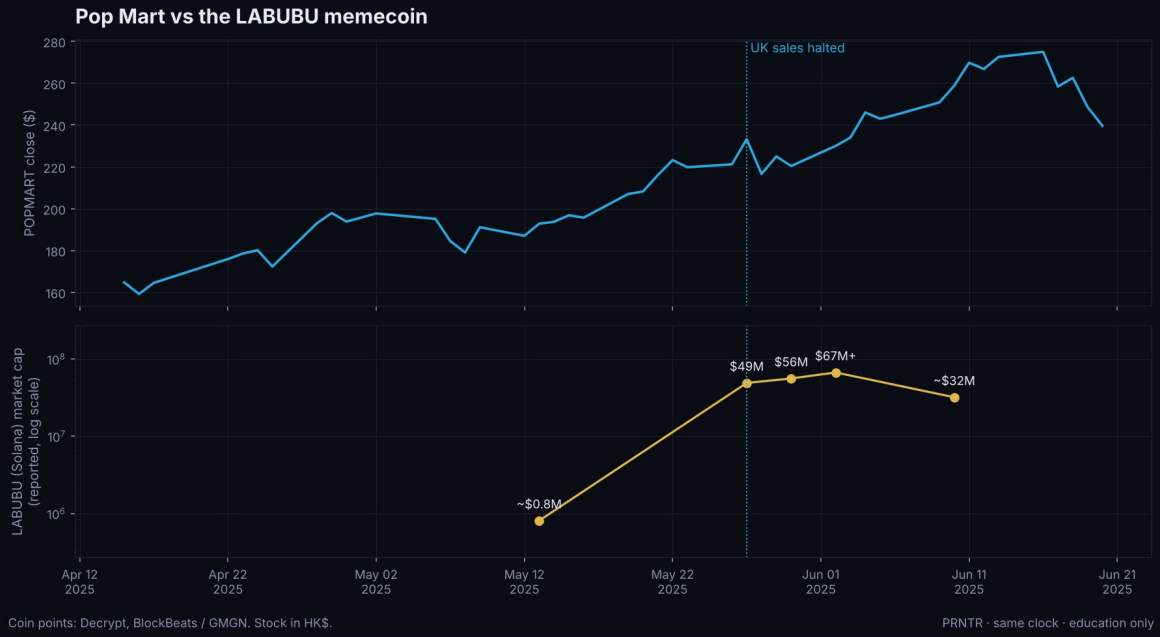

The Box
Nov 15, 2024 to Jan 24, 2025. Ceiling HK$95.25, floor HK$74.75.

Launch up
Feb 4, 2025: closed HK$103.20.

The run
HK$339.80 by Aug 26: 257% above the ceiling. Reuters: up more than 230% for the year.

Lesson
A culture trend shows up in the stock months before it shows up in the coin.

Pop Mart vs the LABUBU coin

The coin
LABUBU (Solana), launched on Pump.fun in Oct 2024. Under $1M for months: about $0.81M before the run.

The run
$49M on May 27, 2025 (+5,934% in two weeks) as Pop Mart halted UK sales. $56M May 30, $67M+ by Jun 2. About $32M by Jun 10.

$10 math
~60x to the first top: $10 → about $600, about $165 with the PRNTR exit.

NVIDIA, Feb 2024: earnings

The Box
Feb 8 to 21, 2024. Ceiling $73.90, floor $67.47 (split-adjusted).

Fake-Out
Earnings day, Feb 21: a wick to $66.25 below the floor, closed back inside.

Launch up
Feb 22: closed $78.54, +16%, a record $277B added in one day.

The coin
'NVDA AI' was created minutes after earnings. One wallet turned $51 into $10,800 (~210x) in about 2 hours. Many think it was the creator's own wallet.

NVIDIA earnings: what to learn

The date was public
Earnings dates are announced weeks ahead. The Box and the Fake-Out on earnings day were the up model in two days.

The coin was a speed game
Made after the news, not before. The only way in was the first minutes, and the best trade may have been the creator's.

The PRNTR read
Stock: the Turn after the Fake-Out was the trade. Coin: a few dollars at most, or skip. New coins made after news are where creators sell to the crowd.

05

Case studies: opposite way

The stock falls, and the coin named after the reason it fell runs. You can be on both sides of the same headline.

CASE 5 · NVDA × THE DEEPSEEK COIN

NVIDIA and DeepSeek, Jan 2025

The Box
Oct 15, 2024 to Jan 24, 2025. Ceiling $149.43, floor $128.91.

Fake-Out
Jan 7: a wick to $153.13 above the ceiling, closed back inside. The down model.

Launch down
Mon Jan 27: DeepSeek's cheap AI model. Closed $118.42 (−17%), about $589B wiped out: the biggest one-day loss for any company on record.

Follow-through
Low of $107.56 by Mar 7.

The coin named after the cause

The coin
An unofficial Solana token named after DeepSeek, created Jan 4, 2025: three weeks before the shock.

The run
Passed $48M market cap on Jan 27 on about $150M of volume, 22,000+ holders. Back to about $30M within hours. A second copy hit ~$13M.

The catch
DeepSeek said it had no token. Dozens of copies existed. We don't have a reliable starting market cap, so we don't show $10 math.

The lesson
NVIDIA fell; the coin about the reason it fell ran. Ask: 'what is the CAUSE called?', and search that name too.

CASE 6 · TSLA × AP

Tesla and the America Party, Jul 2025

The Box
May 8 to Jul 3, 2025. Ceiling $362.89, floor $284.70.

The news
Jul 5: Musk announces the 'America Party'.
Jul 7: Tesla falls about 7%.

No launch
Tesla closed inside the Box. The higher timeframe didn't care, so there was no stock trade.

The coin
'America Party' (AP) on Pump.fun: about $6.5M to $41M within hours (our estimate from price × supply), then −90%. Five or more copies.

America Party: what to learn

Don't force the stock trade

A news day isn't a launch. If the daily close stays inside the Box, the big chart is telling you the story is noise for the stock. Trade the coin, or nothing.

The coin trade was hours

Up 537% in hours, down 90% after. ~6.4x: $10 → about $64 at the top. A cause-coin on a weekend headline is a same-day trade, never a hold.

NVIDIA, 2026: the PRNTR trade

The Box
May 1 to Oct 29, 2026: 126 trading days. Ceiling $239.24, floor $190.01.

Fake-Out
Oct 6: a wick to $243.37 above the ceiling, closed back inside. The down model.

Launch down
Nov 5: closed $181.60, below the floor.

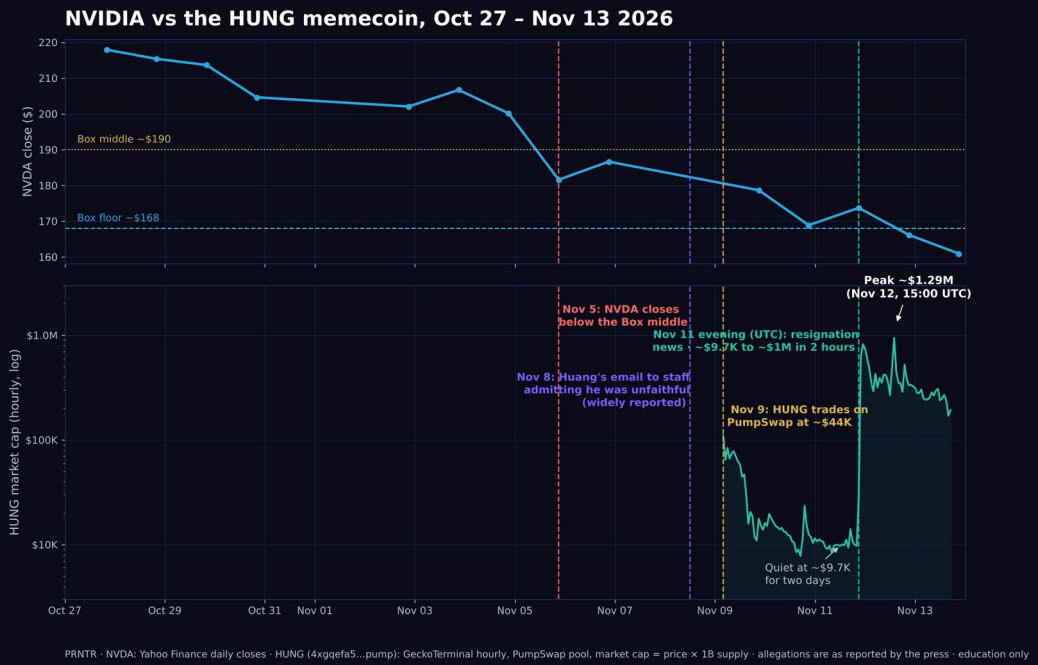

Follow-through
Low $148.80 on Nov 12: 21.7% under the floor.

The 1-hour Turn and the coins

The 1-hour Turn sold at $200.63, before the headlines.

HUNG on the same clock

HUNG went from about $9.7K to about $995K in two hours on the second headline.

The short paid for the coin

+$813

$1,000 at 5x on the short, closed at the $168 target (+4.9R).

$50

of that profit into HUNG at about $9K market cap: about 0.55% of the supply.

~$3,900

selling in pieces around $700K. $10 at $9.7K was worth about $1,000 at the top.

- This is the full PRNTR Crossover: the stock chart gave the direction, the Turn gave the entry, and the profit paid for the lottery ticket.
- HUNG only traded $50–$160 an hour while it was quiet. Buy small or you move the price yourself.

06

Case studies: sell the news

Stock and coin both rise into a date everyone knows, and both fall on it. The money is made before the event, not on it.

Trump Media into the 2024 election

The Box
Sep 3 to Oct 4, 2024. Ceiling $18.63, floor $12.15. An all-time low of $12.15 on Sep 23.

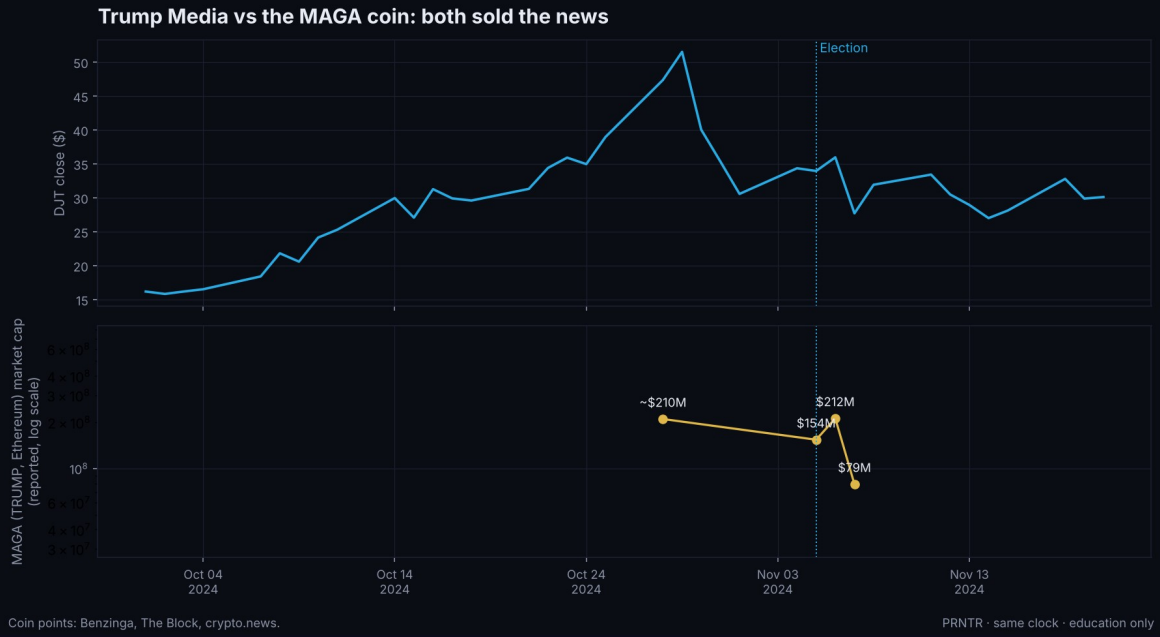

Fake-Out
Sep 13: wick to $20.86, closed back inside.

Launch up
Oct 8: closed $21.80. Top $54.68 on Oct 29: 193% above the ceiling.

Then
−41% in three days before the vote. $29.87 by Nov 19.

CASE 8 · DJT × MAGA

Trump Media vs the MAGA coin

MAGA (ticker TRUMP, Ethereum)
About $210M in late October, $154M on election day, $212M on Nov 6, $79M on Nov 7: −50.7% the day after the result.

Lesson
Both the stock and the coin priced the event in before it happened. The result, even the 'good' result, was the sell signal.

GameStop, June 2024: the livestream

The Box
May 17 to 31, 2024. Ceiling $23.78, floor $18.32.

Launch up
Jun 3: closed $28.00. Pre-market Jun 7: about $61 high reported; daily data shows $48.

The event
Jun 7: early results, a 75M-share sale, then Roaring Kitty's livestream. GME fell about 39–40%.

Coin
GME (Solana): about $24M to about $220M (estimates) overnight into Jun 7, record $471M volume, then −70% by Jun 18.

The livestream was announced the day before

A dated event = a sell date
When everyone knows the time, everyone who bought early sells into it. The coin topped overnight, before the stream.

$10 math
~9x from Jun 6 to the top: $10 → about $90 at the top, about $37 with the PRNTR exit. Holding through the stream gave most of it back.

The stock said it too
A launch that fell back toward the Box on the event day: the up move failed. A failed launch is a Fake-Out on that side.

Trump Media and the official TRUMP coin

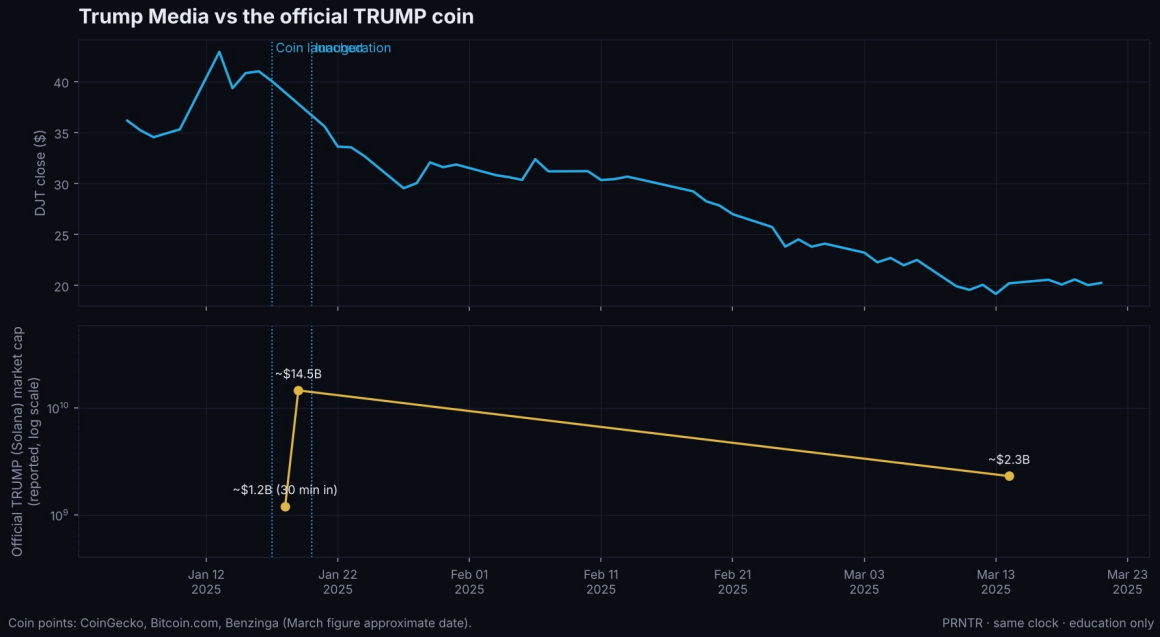

The Box
Nov 19, 2024 to Jan 10, 2025. Ceiling $38.50, floor $29.87.

Launch that failed
Jan 13: closed $42.91 above the ceiling. After the inauguration it fell back inside: −11% to $35.59 on Jan 21.

Then
The failed launch acted as a Fake-Out above the ceiling. The trip across followed, and DJT closed below the floor in February.

Trump Media vs the official TRUMP coin

The coin
Launched from Trump's own accounts on the evening of Jan 17, 2025. About $1.2B within 30 minutes.

The top
$73.43 on Jan 19: about $14.5B market cap. Down 29% in a day by Jan 21. About $2.3B by March.

$10 math
Reported launch price around $0.18. To the top: ~408x, so $10 → about $4,080. PRNTR exit: about $1,035.

TRUMP: the biggest $10 story, honestly

What made it

It came from the person's own account, it was the first official coin of a sitting president-elect, and it was live on a weekend before the stock market could react.

Who got it

Only people in the first minutes. Reported launch prices vary. Most buyers bought far higher, and many held through the −29% day and beyond.

The PRNTR rule

Turn on post alerts for the biggest accounts (Part C). Speed coins: buy a few dollars only from the official account's own link, sell half at 3x, never chase a vertical candle.

07

Case studies: traps and failed launches

The cases where the famous name didn't pay. These are the ones that teach you to size small and run the safety check every single time.

Netflix and Squid Game, 2021

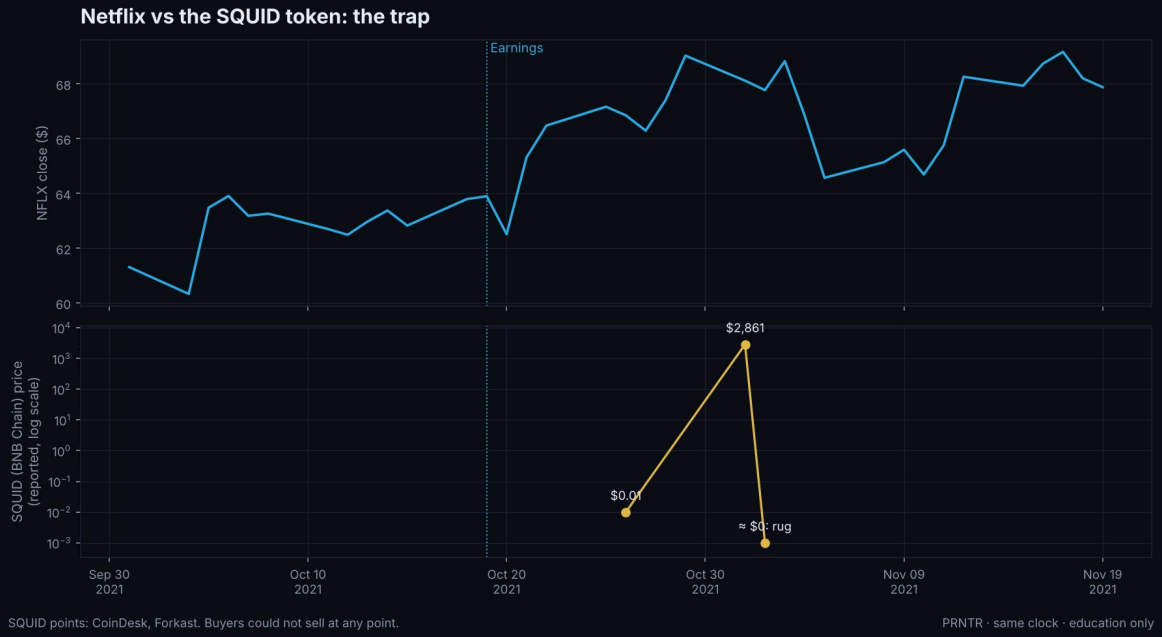

The Box
Jul 15 to Aug 26, 2021 (prices adjusted for the later 10-for-1 split).

Launch up
Aug 27, three weeks before Squid Game came out on Sep 17.

The run
Earnings on Oct 19 credited the show. Record close $691.69 on Nov 17 (pre-split price).

The SQUID token: the trap

The coin
SQUID on BNB Chain, launched around Oct 26, 2021 at about $0.01.

Paper top
$2,861 on Nov 1. On paper, $10 became millions.

Reality
Buyers could NOT sell: the contract blocked it. The creators pulled the pool and took about $3.38M. Price went to about zero in minutes.

Again in 2024
Season 2 copies on Base and Solana mostly fell 99%. PeckShield flagged them as scams.

Rule: can people sell?

1

Check sells

On DEX Screener's Transactions tab, look for sells from wallets other than the creator.

2

Run the scanners

RugCheck for Solana, Honeypot.is and Token Sniffer for Ethereum and BNB chains.

3

Check the creator

Does the creator hold a big share? Did a few wallets take most of the supply at launch?

4

Sell a test

After buying, sell a tiny slice straight away. If it fails, you learned it for a few dollars.

Oracle and Stargate, Jan 2025

The Box
Dec 11, 2024 to Jan 17, 2025. Ceiling $178.58, floor $153.92.

Launch up
Jan 22: closed $184.22 after the Stargate AI venture (high $191.99).

Erased
Five days later DeepSeek hit every AI stock. Oracle fell back into the Box.

The coin
One newsletter reported a 'STARGATE' coin at $19–29M. Chain and contract unverified: low confidence.

AMC, the same week as GameStop

The Box
Apr 1 to May 10, 2024. Ceiling $3.42, floor $2.47.

Launch up
May 13: closed $5.19 (+78%). May 14: high $11.88, then a 42% drop from the open.

The company sold
AMC sold 72.5M shares into the rally.

The coin
A Solana 'AMC' coin was reported up about 5,400%. We couldn't confirm which contract: treat as unverified.

WHAT DIDN'T HAPPEN

Big names with no clean pair

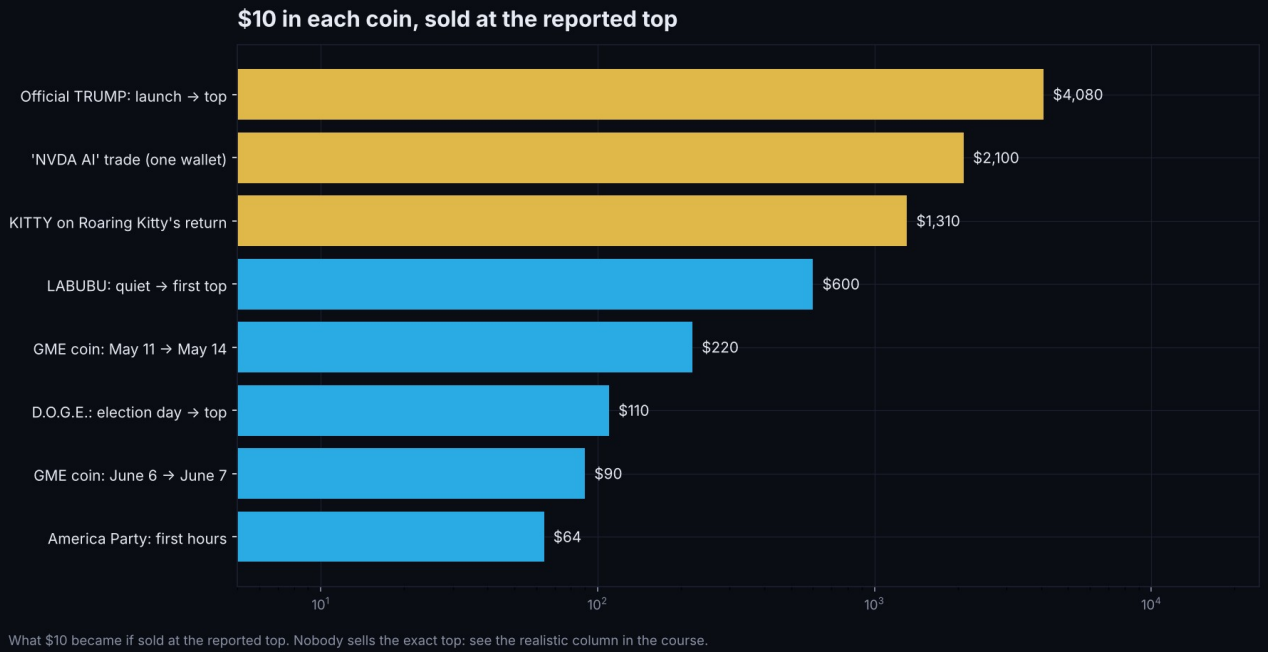

Stock	What we found
MicroStrategy (MSTR)	Rallied hard in Nov 2024. No documented Saylor coin run at the same time.
Robinhood, Coinbase	No coin named after them ran. Their LISTINGS moved coins: PEPE jumped ~30% within an hour of Robinhood listing it (Nov 13, 2024).
Apple, Intel, Microsoft, Meta, Palantir	No verified pair. The OpenAI drama (Nov 2023) moved AI tokens, not a memecoin with data.
Reddit (RDDT)	Only a passing mention of a 'Reddit' coin up 56%. Unverified.
xAI / Grok vs Tesla	The GROK coin went +1,050% in a week (Nov 2023, ~$120–160M) while Tesla didn't move: a coin-only story.
Netflix, Squid Game S2	The 2024 coins were scams that fell 99%. No real Netflix move.

08

The $10 math

How $10 turns into thousands, and why it almost never does from a coin you found on the news. Market cap at entry decides everything.

$10 in each coin, at the reported top

Gold bars: $10 became $1,000+. Every one of them needed an entry in the first minutes or months before the crowd.

Realistic vs the top

Case	Multiple to top	$10 at the top	PRNTR exit*	How you'd have needed to buy
Official TRUMP	~408x	$4,080	$1,035	First minutes after the post
'NVDA AI'	~210x	$2,100	$540	Minutes after earnings (insider risk)
KITTY	~131x	$1,310	$342	Holding the dead coin before the post
LABUBU	~60x	$600	$165	Months before the run, under $1M
GME (May)	~22x	$220	$70	The weekend before the post
D.O.G.E.	~11x	$110	$42	Election day
GME (June)	~9x	$90	$37	The day before the stream
America Party	~6.4x	$64	$31	The first hour

* *Half sold at 3x, the other half sold at half the top multiple.*

Why entry market cap is everything

$10 bought at...	owns	at $100K	at $500K	at $2M	at $10M
$3K market cap	0.33%	$333	$1,667	$6,667	$33,333
$10K	0.10%	$100	$500	$2,000	$10,000
$50K	0.02%	$20	$100	$400	$2,000
$1M	0.001%	n/a	n/a	$20	$100
$4M (GME, May 11)	0.00025%	n/a	n/a	n/a	$25

- Your share of the supply = what you put in ÷ the market cap when you bought. That's the whole game.
- $10 into thousands needs an entry in the low thousands of market cap: the OG coin, months early (Part C).
- A tiny coin can't absorb big sells. At $3K–$10K, even $50 moves the price. Buy small, sell in pieces.

The portfolio math that actually works

20 × $10

OG coins on 20 different events and names: $200 in total.

18 zeros

That's normal. You lose $180.

1 hit

One OG bought at $3K that reaches $2M: $10 → about $6,667.

- Pump.fun's own numbers say how rare this is: 1.8% of launches graduated in Aug 2026 (MadeOnSol), and the median graduate peaked at $31K.
- So the money is in many tiny, early, cheap tickets with dated catalysts, not one big bet on the news.
- Profits go into the money loop: the safe stack first, then leverage with the PRNTR system, never back into one coin.

09

The Crossover playbook

Step by step: before the news, on the day, and after. Both trades, one plan.

Before the news: the watch list

Big names in a Box
Each Sunday, check the weekly and daily charts of the big story stocks: NVIDIA, Tesla, Apple, Meta, Microsoft, Palantir, GameStop, AMC, Trump Media, Coinbase, MicroStrategy, Robinhood, Netflix.

The catalyst calendar
Earnings dates, product events, launches, votes, court dates, premieres. Write them next to each stock.

The names list
For each stock: the ticker, company, products, CEO, the CEO's nickname, the rival, the cause of a possible shock.

Search the names now
Search each name on FOMO and Pump.fun today. Note the OG coins, their creation date, market cap and holders.

Pre-position small
A few dollars in the clean OGs of the names most likely to trend. Log them in your sheet.

Alerts on
Post alerts for the news accounts and the people behind the stocks (Part C).

On the day

1

Read the close

Did the stock close out of the Box? Up or down? Inside = no stock trade.

2

Name the type

Same way, opposite way, sell the news, or trap.

3

Stock trade

On a launch, wait for the 1-hour Turn. Stop beyond the Fake-Out, target the next level.

4

Coin trade

Sell into the spike if you pre-positioned. New coin? A few dollars max, after the safety check.

5

Pay yourself

Half off at 3x. The rest has a plan: the second headline, or a time limit.

After: the second headline

- Big stories come in waves. HUNG moved on the resignation, not the first story. D.O.G.E. topped the day after Musk was named.
- Keep the moon bag only while new headlines keep coming. When the timeline moves on, sell the rest.
- On the stock, the trip across has a target: the other side of the Box. Take profit there.
- Write it up: the Box, the Fake-Out, the coin names, entry market cap, exit, and what you'd change. Your case file is your edge.

Let the stock trade pay for the coin

Step	Stock	Coin
1. Before	Mark the Box, the Fake-Out, the catalyst	Search the names, buy OGs with a few dollars
2. The Turn	Enter with a tight stop, 1–2% risk	Nothing yet, or hold the OGs
3. Target hit	Close or scale out	Put a small slice of the profit into the leading coin
4. The spike	Done	Sell in pieces: half at 3x, the rest on the second headline
5. The loop	Profit to the safe stack	Profit to the safe stack

You only ever risk what the plan allows on the stock. The coin is bought with winnings, so a zero costs you nothing you started with.

Stock catalysts to put on your calendar

Earnings seasons
Late January, April, July and October. NVIDIA reports about a month later (late Feb, May, Aug, Nov).

Big tech events
CES (January), NVIDIA GTC (March), Apple WWDC (June) and its iPhone event (September), Tesla events.

Launches and premieres
A game, a show, a toy, a film. GTA VI (Take-Two) is due in late 2026: confirm the date.

Politics
Votes, inaugurations, new government roles, campaign launches. Nov 2028: the US presidential election.

Crypto listings
Robinhood and Coinbase listings move coins. Watch their announcements.

Shocks you can't date
Rival launches (DeepSeek), resignations (HUNG), posts (Roaring Kitty). Hold OGs in advance; react fast.

10

Front-running narratives: the full playbook

Everything PRNTR teaches about getting in before the crowd, in one place: narratives, the calendar, the OG coin, the supply math, the traders who already do it, and the watch lists.

What front-running means here

Front-running a narrative

Buying the coin a story will send people to, BEFORE the story peaks: days, weeks or months early, while it's cheap and nobody's looking. This is research and patience.

Not front-running people

Buying a coin and then telling your followers to buy so you can sell to them is a different thing. Regulators call it scalping or manipulation. PRNTR never does it (Part E).

CHAPTER 10

The three narratives that move the most

Presidential and politics

Elections, candidates, nicknames, new roles, viral moments. MAGA, D.O.G.E., official TRUMP, America Party.

Elon Musk

One post can create a coin and move it in minutes. D.O.G.E., America Party, GROK. Watch what he posts, names and jokes about.

Anything AI

New models, agents, launches, shocks. DeepSeek, 'NVDA AI', Stargate, the AI-agent coins of late 2024.

Check all three every day. They produced most of the case studies in this book.

Where narratives start

News accounts on X
Breaking-news accounts such as Watcher Guru. A headline can become a coin in minutes. Turn on their post alerts.

FOMO first
Search every new name on FOMO before anywhere else: you see the coins, who's buying, and the traders' records in one place.

Telegram callers and groups
Where coins get shared first. Track which callers are early, not loud.

DEX Screener and Pump.fun trending
A new theme shows up as several coins with the same idea moving on the same day.

The calendar
A big event coming up is a narrative you can see months before it happens.

How to front-run a narrative

1

Spot the theme

Two or three coins on the same idea move on the same day, or a dated event is coming.

2

Find the OG

The first clean coin with the exact name people will type.

3

Check it fast

Safety check, holders, creator, sells. Under two minutes.

4

Enter small

Before the big accounts post. Under $20K market cap is where PRNTR likes to enter.

5

Sell into the crowd

Half at 3x to take your money out. The rest is the moon bag.

Why events are easy to front-run

The date is public
Everyone knows when the Super Bowl, an election, a World Cup final or an earnings call happens.

The crowd searches the name
On the day, new buyers type the event's name into Pump.fun or FOMO and buy what they find. Often that's the first coin with that name.

The OG gets the attention
In memecoins, 'the original' is part of the story. The first coin with the name is the one people screenshot and share.

You get in before anyone cares
Months early, the OG can sit at a few thousand dollars of market cap. A few dollars buys a real share of the supply.

CHAPTER 10

How an event coin moves

Months before

Quiet. The OG sits at a few $K. You buy small.

Weeks before

Talk starts on X and Telegram. Early wallets add.

The days before

Search volume spikes. The crowd buys the name. You sell here.

The day and after

Sell the news. Most event coins fade fast.

Case 8 proves the third column: MAGA was at $212M the day after the vote and $79M the day after that.

Events that already played out

2024 US presidential election
Coins named after candidates, nicknames and slogans ran for months. MAGA, D.O.G.E. (Cases 2 and 8).

The inauguration, Jan 2025
The official TRUMP coin launched 3 days before it and topped the day before (Case 10).

The Super Bowl, every February
Team names, the halftime show, the ads, viral moments.

FIFA World Cup 2022 and 2026
Countries, players, mascots, the final. Each match day brings searches.

Olympics, Paris 2024
Athletes and viral moments became coins within minutes.

Bitcoin halving, April 2024
A dated crypto event. Halving coins moved in the weeks before it.

The calendar ahead (from Nov 2026)

When	Event	Names to search
Late Nov 2026	Thanksgiving, Black Friday, GTA VI (confirm date)	TURKEY, BLACKFRIDAY, GTA6, VICE, LUCIA
Dec 2026 – Jan 2027	Christmas, New Year	XMAS, SANTA, 2027, the year's memes
Feb 2027	Chinese New Year (Year of the Goat), Super Bowl LXI, Valentine's	GOAT (and the old GOAT coin!), the teams, the halftime act
Mar 2027	The Oscars, NVIDIA GTC	Nominees, NVIDIA product names
Jun–Jul 2027	FIFA Women's World Cup (Brazil)	Countries, star players
Oct–Nov 2027	Halloween, Rugby World Cup	Costumes of the year, teams
~Apr 2028	Bitcoin halving	HALVING, the block number
Jul 2028	Los Angeles Olympics	LA28, athletes, mascot
Nov 2028	US presidential election	Every candidate, nickname, running mate, slogan

Dates move. Confirm each one the week before. Earnings dates go on the same calendar.

Build your search list for each event

Every name people will type

The event: SUPERBOWL, WORLDCUP

The short form: SB61, WC2027

Teams, countries, players, candidates

The mascot, the slogan, the meme of the moment

The nickname the internet uses, not the official one

For stocks: the ticker, product, CEO, rival, the cause

One sheet

One row per name: event, date, the OG you found, contract address, created date, market cap when you bought, your supply %, the week you'll sell.

Review every Sunday. New names appear as the date gets closer.

Searching on FOMO and Pump.fun

1

FOMO first

Type each name. See which coins exist and which traders already hold them.

2

Then Pump.fun

Search the same names. Sort by oldest.

3

Open the first one

Created when, by whom, who holds it.

4

Confirm on-chain

Paste the contract into a Solana explorer and check the creation time.

5

Buy small

A few dollars. Log market cap and supply % in the sheet.

Is it really the OG?

Signs it's the original

Created before every other coin with that name

Name and ticker match exactly

The creator doesn't hold a big share

Not bought up by a few wallets in the first seconds

Holders spread out, not one whale

Signs to walk away

A later copy clearly won the crowd

The creator sold early or holds most of it

Bundled launch: a few linked wallets took most of it

Close to the name, but not what people will type

Nobody but the creator has ever sold

The supply math

$15 at $3K

market cap buys 0.5% of the supply. Your share = what you put in ÷ market cap.

$10–15 into $10,000–15,000 needs the coin to reach about $2M–$3M. At $500K, 0.5% is $2,500. Fees and slippage take a little off.

If it reaches	0.5% is worth
$100K	$500
$500K	$2,500
$1M	$5,000
$2M	$10,000
$3M	$15,000

CHAPTER 10

Anniversaries and number memes

The pattern

Some coins run on a date, then go quiet. A year later the same date, meme or season comes back, and so do the buyers. Note every coin that ran on a date and check it again the next year.

Example from the PRNTR desk

A coin called '2026-7' hit about $542K market cap around Nov 7, 2025: the name only made sense because '6-7' was a viral meme. The thesis: same meme, the right year, the same season. A dated idea you can hold early.

This is a thesis, not a promise. Size it like every other OG: a few dollars.

Animal metas: the fastest narratives

1

Catch the story first

Escapes, zoo births, naming contests, viral rescues, celebrity pets, live cams. Local news and X, minutes old.

2

Get the real name

Only the confirmed name: two independent sources or the keeper. Never guess.

3

Check for a coin

Search Pump.fun, DEX Screener and GeckoTerminal. Is there a coin yet?

4

No coin yet?

As a buyer: watch for the first clean one. As a developer: that's a launch idea (Part D).

5

Same rules

OG, safety check, small size, sell into attention.

Moo Deng the hippo and Peanut the squirrel became some of the biggest memecoin stories of 2024. Animal stories move fast and fade fast.

Celebrity and influencer watch list

Build a big list
Celebrities, athletes, rappers, founders, politicians and big crypto accounts. Add anyone who has ever posted a coin, a contract address or a FOMO or Pump.fun link.

Post alerts on
Some post a contract address straight from FOMO. The first minutes decide everything.

Check it's really them
Hacked accounts post fake coins all the time. Check the handle, the history, and whether the coin is linked from their own profile.

Assume it's paid
Many celebrity posts are paid promotions, and many promoted coins dump. The CoinWire study: 86% of promoted coins fell 90%+ within 3 months.

11

Follow the traders who already front-run

You don't have to find every narrative yourself. Find the wallets that keep getting in early, check their pattern, and copy them small.

Find the traders who do this

Look at who holds the OGs
Open the event and narrative coins you found. Wallets that bought months early and hold a real share are often front-runners.

Check their past events
Did they hold last year's election, Super Bowl or anniversary coins early, and sell into the day?

Watch what they hold now
Their current low-market-cap holdings show the next events they're positioned for.

Copy them, small
Put the best ones in a copy bot so you buy when they buy.

Read their pattern on FOMO

Copy this: the ladder

One or two buys, then six or seven sells, again and again. They buy once and scale out on the way up. That's a plan, and it means consistent income.

Avoid this: scattered

One buy, one sell. Five buys, two sells. Random sizes, random timing. That's gambling, even if the last trade won.

FOMO shows each trader's buys and sells in the Transactions tab. Scroll back weeks, not days.

Check what they hold right now

- Open their holdings. Are they in low-market-cap coins with a big share of supply?
- Does the narrative fit something coming up? An event, a name, a meta that's starting to move?
- How long have they held? Months-early holders of a dated event are the ones to study.
- If several good wallets hold the same small coin, that's a signal worth a few dollars.

Find the wallet behind a winning trade

1

Open the chart

The coin the trader you want to copy bought, on DEX Screener.

2

Transactions tab

Scroll to around the time and price they got in.

3

Match two things

The number of tokens they hold, and the market cap they bought at.

4

Found it

Click the wallet. Check its history on FOMO.

5

Track it

Add it to a wallet tracker: the Ray wallet tracker on Telegram (yellow icon).

Copy it with a bot

Chain	Bot	What to set
Solana	Odin	Wallet to copy, a fixed buy size, slippage, a max market cap, and auto-sell rules
Ethereum, Base, BNB and others	Maestro	The same settings. Gas costs more, so size and frequency matter

- Buy size: fixed and small. 1–2% of your trading money per copied trade.
- Auto-sell: half at 3x (2x on very fast coins), the rest on a trailing rule or when the copied wallet sells.
- Skip coins above your max market cap: the copied wallet may be exiting, not entering.
- Use a separate trading wallet for the bot. Never connect your savings wallet.

The PRNTR front-running routine

When	Do this
Every morning (20 min)	News accounts, Elon, AI headlines, the three narratives. Search new names on FOMO. Check the copied wallets' new buys.
Every evening (10 min)	Check open coins against your exit plan. Take the 3x halves. Log everything.
Every Sunday (1 hour)	Big stocks: weekly and daily Boxes. Update the event calendar and search lists. Find new OGs. Review the wallets you copy.
Every month	Update the calendar ahead. Drop wallets that stopped working. Move profit into the money loop.

12

Income without trading: the map

Some of the best money in crypto never touches a chart. Callers, developers, X creators, network builders and username sellers get paid on attention, fees and assets.

Six ways to earn without trading

Caller / KOL
Build an audience that follows your calls. Paid posts, bot referral fees, a paid group, token allocations.

Telegram network
Know the developers, callers and group owners. Channel ad revenue, Stars, introductions, deals.

Developer
Launch coins on Pump.fun and earn creator fees on every trade, for as long as people trade it.

X creator
Grow a following and get paid by X: Original Content Rewards and Subscriptions.

Token supply
Developers give KOLs supply for promotion. Legal only with clear disclosure.

Telegram usernames
Short, valuable names sold as collectibles on Fragment, paid in Gram (the renamed Toncoin).

All six run on the same thing as memecoins: attention. The difference is you get paid for creating it, not for guessing it.

Six changes in 2025–2026 you must know

What changed	Now
X Creator Revenue Sharing	Ended Sep 7, 2026. Replaced by Original Content Rewards (applications from Sep 8, 2026).
Toncoin	Renamed Gram (GRAM) around Jun 15, 2026. Fragment prices in Gram. No swap needed.
Pump.fun fees	1.25% on the bonding curve, 0.30% of it to the creator.
Pump.fun graduation	Goes to PumpSwap (since Mar 20, 2025), not Raydium.
Fragment ID checks	Reported changed around Nov 2, 2026 (not officially announced). Check before you rely on it.
US SEC on memecoins	Feb 2025 staff statement: memecoins are generally not securities. Fraud law still applies.

13

Become a caller (KOL)

A KOL, a 'key opinion leader', is a caller with an audience: a Telegram channel and an X account that post coins with a short reason. Here's how callers actually make money, and the lines they can't cross.

How a caller starts

1

Pick your lane

One niche: event OGs, AI coins, animal metas, the Crossover. Narrow wins.

2

Public channel + X

A Telegram channel for calls, an X account for the reasoning and receipts.

3

Call with a reason

Contract address, the narrative, the entry market cap, the plan, the risk.

4

Post receipts

Wins AND losses. Followers now check caller wallets on-chain.

5

Be consistent

Same time, same format, every day. Trust is built by repetition.

Your wallet is public now

Kolscan
Tracks the Solana wallets of KOLs. Pump.fun bought it in July 2025 (DL News).

Arkham's KOL label
Tags influencers with 100K+ X followers so anyone can see if they sell right after posting.

What the data shows
Across 457 scored KOL wallets, the average 30-day win rate was 42%; about 1 in 4 won more than half their trades (MadeOnSol, unverified).

So
An honest record is the asset. Call it, hold it, post it, win or lose.

How callers get paid

Income	Typical numbers	Confidence
Paid posts	$2,000–$20,000 per post for mid-size accounts, sometimes paid in tokens	Unverified (MadeOnSol)
Paid posts, average	About $399 per promotional tweet across 377 accounts	Study (CoinWire, late 2024)
Rate card, small	$200–$1,000 per post at 50K–200K followers; $5K–$50K at 1M+	Unverified blog
Bot referral fees	A share of the fees your referred users pay, for months or life (next slide)	Official docs for Axiom, Trojan
Paid group	$50–$300 a month for premium calls	Unverified
Token allocations	Supply from developers for promotion (Chapter 16)	Varies

Trading-bot referral fees

Bot / terminal	Referral terms	Source
Axiom	Tier 1 (direct) 30%, tier 2 3%, tier 3 2%	Official docs
Trojan	5 levels; total share 27.5% / 32.5% / 42.5% / 47.5% by tier	Official docs
Photon	30% of referred users' fees, for life	Unverified
GMGN	Up to 30%, tiered	Unverified
BonkBot	About 10–30%	Unverified
Maestro	25%	Unverified

The math: bot fees are about 1% of volume. A follower who trades $10K pays about $100 in fees. At 30%, you earn about $30 from that one person. 300 active followers like that: about $9,000.

CHAPTER 13

Pricing a paid post honestly

Before you take the deal

Run the safety check on the coin like you would for yourself

Check the developer's past launches

Get paid in cash or stablecoins, not only their token

Put it in writing: what you post, when, and that it's labelled

When you post it

Label it #ad or use X's Paid Partnership label

Say if you were paid in tokens and whether you'll sell

Never buy before the post to sell into your followers

Turn down coins you wouldn't hold yourself

What gets callers exposed

Bubblemaps, Nov 5, 2026
Investigated four KOLs. One: about $6M in estimated related profits.

Buying before the call
Another KOL's linked wallets bought about 20 seconds before roughly 61% of ~534 October calls.

Selling minutes after
A third often sold about 3 minutes after calling.

The Pump.fun lawsuit
A US class action (RICO) names 25 unidentified 'KOL' defendants alongside the platform (filed Jul 2025).

Wallets are public. Anything you do with yours will be found.

The caller's first 90 days

Weeks	Goal	Do
1–2	Set up	Channel, X account, bio, pinned post with your rules: 'I disclose paid posts. I don't sell into my calls.'
3–6	Track record	1–3 calls a day with the reason and entry market cap. Weekly recap of every call, wins and losses.
7–10	Grow	Reply to bigger accounts with real value. Post one breakdown a day on X. Cross-post receipts.
11–13	Monetize	Add bot referral links, open a paid tier for deeper calls, take only paid posts you'd hold yourself.

14

Build your Telegram network

Telegram is where coins get shared first, deals get made and launches get coordinated. Your network is an asset you can earn from in clean ways.

CHAPTER 14

Who you want to know

Developers
They need honest callers, artists, moderators, web builders and early holders who don't dump.

Callers
Share research, trade notes, cross-promote channels. A group of good callers is a moat.

Group owners
Run the communities where coins live. They hire moderators and buy promotion.

Builders
Bot makers, designers, video editors, website builders: the launch team.

How relationships form

1

Give first

Free research, a fixed website, a clean logo, a moderation hour. Do one useful thing.

2

Be reliable

Show up, keep your word, don't dump on people. Reputation spreads fast in small chats.

3

Join the right chats

Developer and caller group chats are invite-only. Invitations come from people who trust you.

4

Bring deals both ways

Introduce a developer to an artist, a caller to a developer. Introductions get remembered.

Telegram's own money

Channel ad revenue

Public channels with 1,000+ subscribers get 50% of the ad revenue Telegram earns in that channel. Withdrawals go through Fragment (Telegram blog, March 2024).

Telegram Stars

Paid posts, subscriptions and gifts in Stars. Stars can be withdrawn 21 days after they're earned (Telegram creator terms). Minimum withdrawal and the dollar rate change: check the current numbers.

The red lines in group chats

- Getting a contract address early in a private chat, then calling it publicly while you sell, is front-running your followers: fraud and manipulation exposure in the US, the EU (MiCA Article 91) and the UK.
- Chats that coordinate buys and sells are where pump-and-dumps are organised. An academic study names Telegram and Discord as the main hubs.
- Members of a coordinating chat can be named as co-conspirators. See the Pump.fun RICO case and US v. Constantinescu (reinstated by the Fifth Circuit, Oct 2025).
- If a chat asks you to buy together and sell into a call: leave it.

15

Become a developer: launch coins

A developer creates the coin. On Pump.fun, launching is free except network fees, and the creator earns a fee on every trade. Here's the full flow, the real fee numbers, and the honest launch.

Launching on Pump.fun, step by step

1

Separate wallet

Connect a fresh Solana wallet (Phantom or Solflare) used only for launches.

2

Start a new coin

Name, ticker, description, image (512×512). Add X, Telegram and website links.

3

Dev buy (optional)

Buy some of your own supply at launch. Disclose it publicly.

4

The bonding curve

The coin trades on Pump.fun's curve. Buyers push the price up the curve.

5

Graduation

At about 85 SOL deposited, it moves to PumpSwap automatically, and the pool tokens are burned.

What it costs

$0

platform fee to create a coin. You pay only Solana network fees.

0.015 SOL

graduation fee, taken from the coin's reserves, not your wallet.

Your time

art, website, X account, community. That's the real cost.

- Older guides mention a ~0.02 SOL creation fee and 1.5 or 6 SOL graduation fees. Those are out of date.
- Since July 2026, BOOST is the default: part of the migration pool is used for automatic buys in the first 5 minutes after graduation, and those tokens are burned.
- USDC-paired launches were added in May 2026 (unverified).

Creator fees: how developers get paid

Phase	To creator	To protocol	To pool	Total
Bonding curve	0.30%	0.95%	0%	1.25%
PumpSwap, 0–420 SOL market cap	0.30%	0.93%	0.02%	1.25%
PumpSwap, 420–1,470 SOL	0.95%	0.05%	0.20%	1.20%
PumpSwap, 98,240+ SOL	0.05%	0.05%	0.20%	0.30%

- The creator share steps down through 25 tiers between 420 and 98,240 SOL market cap. Non-official PumpSwap pools pay the creator 0%.
- Claim: Profile → More → Creator rewards → Claim all. No minimum. Fees can be split across up to 10 wallets, or sent to holders ('Holder Rewards').
- Example: $1M of volume on the curve pays the creator about $3,000. A coin that keeps trading keeps paying.

The honest odds

When	What happened	Source
Aug 1–28, 2026	1,032,440 launches from 223,339 wallets. 1.8% graduated. Median graduate topped at $31K.	MadeOnSol (unverified)
Week to Jun 16, 2026	Graduation rate fell to 0.26%. Pump.fun revenue ~$800K a day, down from $4.8M six months earlier.	The Block
Late Jul 2026, after BOOST	Graduation rate peaked at 6.7%.	The Block
Jan 2024 – May 2025	~7M tokens; 98.6% showed scam or pump-and-dump traits; ~1.4% kept $1,000+ in their pool. Pump.fun disputed it.	Solidus Labs

Most launches go nowhere. Developers who earn do it with many cheap launches on real narratives, or one coin with a real community.

CHAPTER 15

What makes a launch work

A narrative people search
The same rules as buying: a name the crowd will type, at the moment they'll type it. First is a story.

Art and a meme
A clean logo, a reason to share it, a joke people get in one second.

The basics done
Website, X account, Telegram, a pinned post that explains it.

A community, not a dump
Holders who stay. Moderators. Daily posts. A plan beyond day one.

Something to do
A game, a tool, a launchpad, holder rewards, a charity split. Utility gives people a reason to stay.

Fair start
No secret bundled supply, dev buy disclosed, no secret paid callers.

Honest launch vs rug pull

Honest launch

No secret bundled or sniper wallets

Dev buy and team wallets disclosed

No undisclosed paid KOLs

No selling into a coordinated hype push

You earn from fees and the community, not from dumping on buyers

Rug pull (crime)

Bundled wallets buy at launch and trace back to you

The developer sells once buyers arrive and walks away

Fake promises of a team, a roadmap or a listing

Pulling the pool (like SQUID)

Rug pulls are prosecuted as wire fraud: the Frosties NFT creators (US, 2022), and in South Korea five people over a Pump.fun coin, 'CatFi', about $600K.

Other launchpads

Launchpad	What it is	Notes
Pump.fun	The main Solana launchpad. Free to launch, creator fees, PumpSwap.	The default for this book
LetsBonk / Bonk.fun	Built on Raydium LaunchLab. 1% swap fee used for operations, validators and BONK buybacks.	Briefly passed Pump.fun in mid-2025
Moonshot (DEX Screener)	Launched Jun 2024 with no presales or insider allocations; now mostly a mobile trading app.	2M+ users reported (unverified)

16

Grow on X, and get paid by X

X shares revenue with creators. The old Creator Revenue Sharing program ended in September 2026; Original Content Rewards replaced it. Here's how to grow and qualify.

What the X algorithm rewards

Replies, reposts, likes, profile clicks, time spent
X open-sourced its Grok-based ranking in January 2026. These are the signals it predicts.

Blocks, mutes and reports
Count against your posts. Rage-bait that gets you muted costs you reach.

Engagement bait
Asking for likes, reposts or follows 3+ times can disqualify you from the rewards program (unverified).

Original posts
The rewards program pays on original posts only. Reposts and aggregation don't count.

A content plan for a crypto X account

Post type	Example	How often
The breakdown	A Crossover chart: the Box, the coin, the timeline	Daily
The receipt	Your call, the entry market cap, the result, win or lose	Every call
The thread	'How I found the OG for X event' with screenshots	2–3 a week
The calendar	Events coming up and what you're watching	Weekly
The reply	Real value under bigger accounts' posts, early	10–20 a day

Original, useful, consistent. That's both what grows the account and what the rewards program pays for.

Original Content Rewards: who qualifies

- An active Premium, Premium+ or Premium Business subscription
- 18 or older, in one of 100+ eligible countries
- 500 verified followers
- 500,000 Home Timeline impressions from verified users in the last 90 days (replies don't count)
- An account in good standing, posting original content
- Not eligible: reposts and aggregation, posts about monetization or coaching, political and government accounts
- Decision in up to 3 business days, one appeal, reapply after 90 days if rejected (unverified)

How X pays

What counts
'Qualified impressions': unique Home Timeline views of your original posts by Premium users, with at least half the post on screen. Paid and repeat views don't count.

When
Every two weeks, $30 minimum. US creators get a 1099-NEC.

How much
X publishes no rate. Under the old program creators reported about $8–9 per 1M verified impressions. No OCR payouts reported yet.

Subscriptions
Followers pay you monthly ($2.99–$9.99 is typical). You keep up to 97% until $50K lifetime, then up to 90% (English help page).

Treat X payouts as a bonus. The real value of the audience is your caller, referral and group income.

17

Token supply as a KOL

Developers give callers part of the supply, before launch or at a discount, in exchange for promotion. It's common. It's only legal and ethical when your followers know.

How it works

KOL round
A discounted, pre-launch allocation in exchange for agreed promotion. Common in bigger launches.

Memecoin deals
Informal. The developer sends supply directly, or puts you on a list for an early buy.

Paid in tokens
A paid post settled in the coin instead of cash.

Vesting
Tokens unlock over time so you can't dump on day one. Memecoin deals often have none.

Typical terms (examples, not a standard)

Project	Unlocked at launch	Cliff	Then
Yom	20%	3 months	Linear over 6 months
XYRO	10%	1 month	Linear over 9 months
Grindery	15%	1 month	Over 8 months

- One guide describes KOL rounds as 5–15% of the raise, spread across 10–30 creators, vesting over 12–24 months (unverified).
- The known risk: the 'KOL dump' when tokens unlock. Vesting terms are rarely public, so buyers can't see it coming.

Taking supply the right way

1

Vet the coin

Same safety check as a buy. Would you hold it with your own money?

2

Get it in writing

Amount, vesting, what you'll post, when.

3

Disclose clearly

'I was given X% of supply for promoting this. I may sell.' #ad or X's Paid Partnership label.

4

Don't dump on calls

Never sell into your own post. Sell on a schedule you disclosed.

5

Pay the tax

Tokens received for work are income at their value when received (US).

What happened to people who didn't disclose

Who	What	Result
Kim Kardashian (2022)	Paid $250K for an EthereumMax post, not disclosed	$1.26M paid to the SEC; 3-year promotion ban
8 celebrities, Justin Sun case (2023)	Lohan, Jake Paul, Soulja Boy, Ne-Yo, Akon and others promoted TRX/BTT	Six settled, $400K+ in total
Mayweather, DJ Khaled (2018)	Paid ICO promotions, not disclosed	SEC charges and settlements
Paul Pierce (2023)	EthereumMax promotion	SEC settlement

Memecoins are generally not securities (SEC staff, Feb 2025), so some of these rules may not apply to pure memecoins. Fraud, FTC and foreign rules still do.

18

Sell Telegram usernames on Fragment

Telegram usernames and anonymous numbers can be turned into collectibles and sold at auction on Fragment, on the TON blockchain, paid in Gram.

How a username becomes a collectible

1

Connect

A self-custody TON wallet (Tonkeeper or MyTonWallet) and your Telegram account on Fragment.

2

Convert

Pick a username linked to your account, group or channel and set a minimum bid.

3

Wait for a bid

You can cancel only before the first bid. After it, the change is permanent.

4

7-day auction

The first bid starts a 7-day auction. You can set a buy-now price.

5

Settle

The winner gets it as an NFT in their wallet. You get Gram, minus fees.

CHAPTER 18

Fees, payments and anonymous numbers

Fees
5% on every collectible sale. A one-time 5 Gram conversion fee from the first auction. About 1 Gram per blockchain transaction.

Gram
Toncoin was renamed Gram (GRAM) around Jun 15, 2026. No swap needed. Any page asking you to 'claim' or 'migrate' Gram is a scam.

Anonymous numbers
+888 numbers that only work to sign up for Telegram. Login codes appear on Fragment. About 136,500 exist; resale only since 2022.

ID checks
Fragment added ID checks in Nov 2024. A Nov 2026 report says they were dropped for some purchases but still apply to withdrawing earnings. Check before you rely on it.

What sold, and what makes a name valuable

Item	Price	When
@auto (first username sold)	900,000 TON (~$1.4M)	Nov 2022
@news	~$1.7M at the time	Nov 2022
+888 8 888 (number)	300,000 TON (>$730K)	Dec 2022
@danbao (reported record)	~$2M	Feb 2026 (single source)

What buyers pay for

Short: 4–5 letters

Real words: news, auto, bank, game

Brand-safe words, not company names

Words valuable in big markets (English, Chinese, Russian)

A name people would type to find a channel

Never register or sell a name that copies a trademark or pretends to be a brand. That's how names get taken and sellers get sued.

19

More income in crypto, no trading

Smaller streams that stack: referral fees, airdrops, bug bounties, jobs, launch services, ambassador programs and a paid community.

More ways to earn

Stream	How it pays	Watch out for
Airdrops	Free tokens for using a project early. Income when you control them (US: Rev. Rul. 2019-24).	Running many wallets breaks the rules and gets filtered: Starknet cut ~27K wallets
Bug bounties (Immunefi)	~$7.3M paid in Q1 2026 across 1,268 reports. Records: $10M (Wormhole), $6M (Aurora).	Stay in scope. Exploiting first and negotiating after can be charged as theft
Community manager	Web3.career average ~$80K ($40K–$180K); CryptoJobsList mean ~$69K.	Thin job postings in 2026
Launch services	Websites, art, video, bots, moderation for developers.	Get a contract. Tokens as pay are income
Ambassador programs	Tokens or points for promotion and community work.	Same disclosure rules as paid posts
Paid group	Telegram Stars subscriptions, or Whop for a paid Discord.	Paid signals can be regulated advice in the UK and EU

Stack them: one person, five streams

1

Content

Daily X breakdowns build the audience. X pays a little.

2

Calls

The Telegram channel turns the audience into followers who act.

3

Referrals

Bot links earn a share of your followers' trading fees.

4

Paid tier

Your best research in a paid group or Stars subscription.

5

Launches and deals

Your network brings launch work, disclosed paid posts and allocations.

Each stream feeds the next. And none of them need you to win a trade.

20

The rules: law, tax and safety

What gets people sued, fined or charged, in one place. Not legal advice: rules differ by country and change often. Talk to a lawyer and an accountant where you live.

The law, in one table

Where	Rule	In plain words
US · FTC	Endorsement Guides (2023)	Disclose any payment, free product or free tokens clearly. '#ad' or '#sponsored', not '#sp'.
US · SEC	Securities Act §17(b)	If a token is a security, being paid to promote it without saying so is illegal.
US · courts	Wire fraud; US v. Constantinescu	Buy, hype, then sell while misleading followers can be charged as fraud (reinstated Oct 2025).
EU · MiCA	Articles 7 and 91	Marketing must be clearly marked. Promoting a coin you hold, without saying so, is manipulation.
UK · FCA	s.21 FSMA, FG24/1	Unlawful crypto promotions are a crime: up to 2 years in prison and/or an unlimited fine.
Everywhere	Fraud law	Rug pulls and fake promises are fraud, whatever the token is called.

The PRNTR code

Disclose everything
Paid posts, free tokens, your holdings, your plan to sell.

Never sell into your own call
Buy before your followers only if you say so, and never dump on them.

Never rug
No secret bundles, no pulled pools, no fake roadmaps.

No coordinated pumps
Leave any chat that organises buying and selling together.

Protect your followers
Safety-check what you share. Say when something is a long shot.

Keep records
Every call, payment and trade. You'll need them for tax and trust.

Tax basics (US example)

- Selling a coin for more than you paid is a capital gain. Under a year held = taxed like income.
- Airdrops, creator fees, referral fees, X payouts and tokens received for promotion are ordinary income at their value when you receive them.
- X issues a 1099-NEC to US creators. Platforms and exchanges may report too.
- Fragment sales are taxable. So are Stars and channel ad revenue when withdrawn.
- Keep a sheet: date, coin, amount, dollar value, why you received it. A crypto tax app helps.
- Other countries differ. Ask an accountant where you live.

Safety: keep what you make

Three wallets
Vault (savings, never connected), trading (bots and buys), burner (new sites, mints, launches).

Bots get access
Copy bots and trading bots hold keys. Only keep what you'd be OK losing in them.

Phishing
Fake Fragment, fake 'claim your Gram', fake airdrops, fake support DMs. Type addresses yourself.

Hacked accounts
Celebrity and caller accounts get hacked to post fake coins. Check before you buy.

21

Your 90-day plan

Pick one trading path and one income path. Run them side by side for 90 days, review weekly, and keep what works.

Days 1–30: set up and study

Week	Trading (the Crossover)	Income (pick one path)
1	Three wallets. FOMO, DEX Screener, Odin/Maestro set up. Read Part A.	Choose: caller, developer, X creator, network, usernames
2	One case study a day. Draw the Box on 5 big stocks, weekly and daily.	Set up the channel / X account / launch wallet / Fragment wallet
3	Build the event calendar and search lists. Find 10 OGs.	First 7 posts or 1 test launch or 3 names listed
4	Buy small in 5 clean OGs. Find 3 ladder traders on FOMO.	Post receipts. Ask for nothing yet.

Days 31–90: run it and review

Month	Trading	Income
2	Copy 2–3 wallets at 1–2% each. Trade one Crossover with the full plan. Log every trade.	Daily content. Add referral links. One collaboration with another caller or developer.
3	Drop wallets that stopped working. Move profit into the money loop. Write up each case.	Open a paid tier or take your first disclosed deal. Apply for X rewards once eligible.

Every Sunday: what made money, what lost money, what you'll stop. Bring the sheet to your 1-on-1 call.

SUMMARY

The 12 rules

1. Read the stock's weekly and daily Box first
2. Name the pair type before you trade
3. Sell type-3 coins before the event
4. Run the safety check every time
5. Buy the OG, months early, a few dollars
6. Your share = money in ÷ market cap
7. Half off at 3x, always
8. 1–2% risk per trade, no exceptions
9. Let the stock trade pay for the coin
10. Copy ladder traders, never scattered ones
11. Disclose every paid post and free token
12. Never sell into your own call

Glossary

Word	Meaning
The Box	A sideways stretch on the chart. Ceiling = highest close, floor = lowest close, middle = halfway
Fake-Out	A poke beyond the ceiling or floor that closes back inside
The Return	The close back inside the Box after a Fake-Out
The Turn	The lower-timeframe change of direction that gives the entry
The trip across	The move from one side of the Box to the other
Launch Pad	A Box that closes out of the side opposite its Fake-Out: the base of the big move
OG coin	The first coin made with a name
Market cap	Price × supply. Pump.fun coins have 1 billion tokens
Graduation	A Pump.fun coin filling its curve and moving to PumpSwap
KOL / caller	Someone with an audience who posts coins
Moon bag	The part you keep after taking your money out
