PRNTR

THE MEMECOIN COURSE

Front-run narratives, find the wallets that keep winning, copy them with a bot, and move the profits into a system that pays you.

Part of the PRNTR 1-on-1 Mentorship. Education only, not financial advice.

START HERE

How this course works

Lessons 1–2: safety and the game
Wallets that can't take your savings with them, and how memecoin money is really made and lost.

Lessons 3–5: narratives, events and attention
Spot the theme the market is about to care about, front-run dated events, and get in before the crowd.

Lessons 6–7: find and vet the wallet
DEX Screener's top traders, FOMO transaction patterns, and what they hold right now.

Lessons 8–12: copy, size, profit, the loop, a case study
Copy with a bot, size small, take profit, move it into leverage, then see it all in a real trade.

The promise

Not that you'll win every coin. Most lose. You'll lose small on the losers, take real money off the winners, and move it somewhere safer every time.

THE HONEST WARNING

Read this before you start

Most memecoins go to zero. Some are built to steal from buyers.

Never use money you need for rent, bills or your family.

Small size on every single trade. That's what keeps you in the game.

This course is education, not financial advice. Past results, including mine, don't guarantee future results.

01

Wallets and security

Set up three wallets so a scam, a bad bot or a mistake can never reach the money you keep.

LESSON 1

The three-wallet setup

Vault

Your savings and profits. Hardware wallet if you can. Never connects to a site, never goes near a bot. You only send money in.

Trading wallet

For hand trades on DEXs. Holds only this week's trading money. Connects to sites, so treat it as exposed.

Bot wallet

Created inside the copy-trading bot. The bot holds its key, so only fund what you're willing to lose. Withdraw profits often.

Scams to spot before you buy

Honeypots
You can buy but can't sell. Check that other wallets have sold successfully.

Unlocked liquidity / dev holding a lot
The creator can pull the money or dump a big bag on you.

Bundled and sniped launches
A few wallets bought most of the supply in the first block. They're the exit.

Drainer links and fake airdrops
Never sign a transaction you don't understand. Never connect your vault.

The PRNTR safety check: under 2 minutes

1

Run a free scanner

Solana: RugCheck. Other chains: a honeypot checker such as Honeypot.is or Token Sniffer.

2

Check it can be sold

On DEX Screener, other wallets have sold, not only bought.

3

Check the holders

No single wallet, and not the creator, holds a big share of the supply.

4

Check the liquidity

Liquidity locked or burned, and deep enough for your exit.

5

Any red flag: skip

There's always another coin. A skipped trade costs nothing.

02

How memecoin money is made

The life cycle of a coin, and where in it the money changes hands.

LESSON 2

The life of a memecoin

1

Launch

Creator, snipers and insiders get the first supply.

2

Early attention

Smart wallets and early callers buy. Volume starts rising.

3

The narrative spreads

X, Telegram, trending lists. New buyers pile in. Price runs.

4

Peak

Everyone is talking about it. Early buyers are selling into them.

5

Bleed

Volume dries up. Late buyers hold the bag.

LESSON 2

Where you want to be

Buy here: stage 2

After launch chaos settles and before the crowd arrives. Real wallets are buying, volume is rising, the narrative is just starting to spread.

Sell here: stages 3–4

Into the crowd. When your timeline is full of it and strangers are asking about it, you're selling to them, not buying from them.

03

Finding and front-running narratives

A narrative is the story the market is about to care about. Find it early and the coins come to you.

LESSON 3

What a narrative is

A theme that pulls attention, and money, to a group of coins at the same time.

Tech
AI agents, new apps

Politics and news
Elections, viral headlines

Celebrity and culture
A post, a meme, a moment

Scheduled events
Launches, listings, big days

Animal and meme metas
The next dog, cat, frog

New platforms
A new launchpad or chain trend

LESSON 3

The three narratives that move the most

Presidential and politics

Elections, candidates, nicknames and viral moments from the campaign trail. The biggest attention waves in memecoins.

Elon Musk

One post can create a coin and move it in minutes. Watch what he posts, names and jokes about.

Anything AI

New AI tools, agents, launches and headlines. The meta comes back with every big AI story.

Where narratives start

News accounts on X
Breaking-news accounts such as Watcher Guru. A headline can become a coin within minutes, so news is the first place to look.

Telegram groups and callers
Where coins get shared first. Track which callers are early, not loud.

Trending on DEX Screener and launchpads
New themes show up as several coins with the same idea trending at once.

The news and the calendar
A big event coming up is a narrative you can see before it happens.

LESSON 3

How to front-run a narrative

1

Spot the theme

Two or three coins on the same idea start moving on the same day.

2

Find the leader

The first coin with real volume and real holders is usually the one the crowd buys.

3

Check it fast

Scam checks, liquidity, holders. Under two minutes.

4

Enter small

Before the big accounts post about it. Size it so a zero doesn't hurt.

5

Sell into the crowd

When the timeline catches on, you take profit.

04

Front-running the calendar

The biggest narratives are on the calendar months ahead: elections, the Super Bowl, the World Cup. Find the first coin named after the event while it's worth almost nothing.

Why events are easy to front-run

The date is public
Everyone knows when the Super Bowl, an election or a World Cup final happens. You don't have to guess when attention arrives.

The crowd searches the name
On the day, new buyers type the event's name into Pump.fun or FOMO and buy what they find. Very often that's the first coin made with that name.

The OG gets the attention
In memecoins, "the original" is part of the story. The first coin with the name is the one people screenshot, share and pile into.

You get in before anyone cares
Months early, the OG can sit at a few thousand dollars in market cap. A few dollars buys a real share of the supply.

LESSON 4

How an event coin moves

Months before

Quiet. The OG sits at a few $K market cap. You buy small.

Weeks before

Talk starts on X and Telegram. Early wallets add.

The day itself

Search volume spikes. The crowd buys the name. This is where you sell.

After

Attention moves on. Most event coins fade fast.

You buy in the first column and sell in the third. You never need to be right about who wins the game or the election, only that people will care on the day.

Events that already played out

2024 US presidential election
"PolitiFi" became its own narrative: coins named after candidates, nicknames and slogans ran for months before election day.

The Super Bowl (every February)
Team names, the halftime show, the ads and viral moments all get coins, before and during the game.

FIFA World Cup 2022 and 2026
Country names, star players, mascots and the final. Each match day brings a new wave of searches.

Paris Olympics 2024
Athletes and viral moments became coins within minutes, and early holders sold into the attention.

Bitcoin halving, April 2024
A dated crypto event. Halving-themed coins moved in the weeks before it.

Holidays: Halloween, Thanksgiving, Christmas, New Year
The same idea every year. The calendar never changes.

The calendar ahead

Nov 2026	GTA VI release
Feb 2027	Super Bowl LXI, Grammys
Jun–Jul 2027	FIFA Women's World Cup, Brazil
2028	Bitcoin halving (around April)
Nov 2028	US presidential election
Dec 2026	Christmas, New Year
Mar 2027	The Oscars
Oct–Nov 2027	Cricket and Rugby World Cups
Jul 2028	Los Angeles Olympics
Every year	Halloween, Thanksgiving, big product launches

Dates move. Confirm each one the week before you trade it.

Build your search list for each event

Write down every name people will type

The event: SUPERBOWL, WORLDCUP

The short form: SB61, WC2027

The teams, countries, players, candidates

The mascot, the slogan, the meme of the moment

The nickname the internet uses, not the official one

Keep it in one sheet

One row per event: date, search names, the OG coin you found, its contract address, market cap when you bought, your supply %, and the week you plan to sell.

Review it every Sunday. New names appear as the event gets closer.

Searching an event on Pump.fun and FOMO

1

Search the name

Type each name from your list into FOMO first, then into Pump.fun.

2

Sort by oldest

Look for the earliest-created coin with that exact name or ticker.

3

Open the first one

Check when it was created, who created it and who holds it.

4

Confirm on-chain

Paste the contract into a Solana explorer and check the creation time matches.

5

Buy small

A few dollars. Note the market cap and your % of supply in your sheet.

Is it really the OG?

Signs it's the original

Created before every other coin with that name

The name and ticker match the event exactly

The creator doesn't hold a big share of supply

It wasn't bought up by a few wallets in the first seconds

Other holders are spread out, not one whale

Signs to walk away

A later copy with more holders is clearly the one people chose

The creator sold early or holds most of the supply

Bundled launch: a few wallets took most of it at once

The name is close but not the one people will search

It can't be sold (check others have sold)

The math: your share of the supply

$15 at $3K

market cap buys 0.5% of the supply. Your share = what you put in ÷ the market cap.

To turn $10–15 into $10,000–15,000, the coin has to reach about $2M–$3M. At $500K, 0.5% is worth $2,500. Fees and slippage reduce these a little.

If the coin reaches	0.5% is worth
$100K	$500
$500K	$2,500
$1M	$5,000
$2M	$10,000
$3M	$15,000

Rinse and repeat: the event portfolio

20 events

a few dollars on the OG of each

19 zeros

That's normal. Each one only cost a few dollars.

1 hit

can pay for all of them many times over

- Same small amount on every event coin, never more because you "feel sure"
- Set a reminder for the week of the event: sell into the attention, before the day ends
- Take your starting money out as soon as it multiplies, let a small part ride
- Profits go into the money loop (Lesson 11), never back into one big bet

Find traders who already do this

Look at who holds the OGs
Open the event coins you found. Wallets that bought months early and hold a real share are often event front-runners.

Check their past events
Did they hold last year's Super Bowl or election coins early, and sell into the day? That's the pattern you want.

Watch what they hold now
Their current low-market-cap holdings show you the next events they're positioned for (Lesson 7).

Copy them
Add the best ones to your copy bot (Lesson 8), sized small, so you're in when they buy the next OG.

What goes wrong with event coins

Crowd picks another

A later copy, a celebrity's coin or an "official" one can take all the attention. The OG isn't guaranteed to win.

It dies before the day

Months is a long time. Many event coins lose their community long before the event.

You can't get out

Tiny coins have little liquidity. Selling a big share can crash the price. Sell in pieces, early.

05

Reading attention

Hype leaves fingerprints in the numbers. Learn to tell real momentum from a fake pump.

Real momentum vs a fake pump

Real momentum

- Holders growing steadily
- Volume rising with price
- Many different wallets buying
- Mentions growing from different accounts
- Buys and sells both healthy

Fake pump

- A few wallets doing most of the volume
- Holders flat while price jumps
- Same-block buys at launch (bundles)
- The same accounts posting it over and over
- Dev or top wallets holding a big share

The PRNTR entry rules

<$20K

market cap when you get in

50% at 3x

sold to take your risk off the table

Moon bag

the other 50% rides for the full move

Early, small, and the risk comes out at 3x. After that the trade can only cost you profit, never your money.

When to skip: "I'm too late"

- The big accounts have already posted it and the price has already run several times
- Volume is falling while price is still near the top
- The early wallets you'd copy are already selling
- You can't explain why the next buyer would pay more than you
- You feel you have to get in now. That feeling is the signal to wait.

06

Finding the trader's wallet

Use a coin they already won on to find their wallet on DEX Screener.

Find the wallet behind a winning trade

1

Pick a coin that ran

One that already went up a lot, or the coin a trader you follow is in.

2

Open it on DEX Screener

Search the coin, open its pair page.

3

Open "Top Traders"

It lists wallets ranked by profit on that coin: what they bought, sold and made.

4

Pick the early winners

Wallets that bought early and sold well, not the ones that only bought.

5

Copy the address

Click the wallet and copy it. Now check it (Lesson 7).

Finding a specific trader you want to copy

1

Note what they bought

The coin, how many tokens they hold, and the market cap they got in at.

2

Open DEX Screener

Search the coin and open its chart.

3

Go to the Transactions tab

Scroll back to the time and market cap of their entry.

4

Match the token amount

Find the buy with the same number of tokens at that market cap. That's the wallet.

5

Do your own checks

Confirm it on a second coin they're in before you trust it.

07

Checking a wallet before you copy it

One lucky trade proves nothing. Here's how to tell skill from luck, insiders and bots.

The wallet checklist

A real track record
Dozens of trades, not one or two. Profitable across many coins over weeks.

Buys early, but not insider-early
Buying in the very first block or seconds of launch often means sniper, insider or dev.

Sells well, not only buys well
Takes profit on the way up instead of riding coins back to zero.

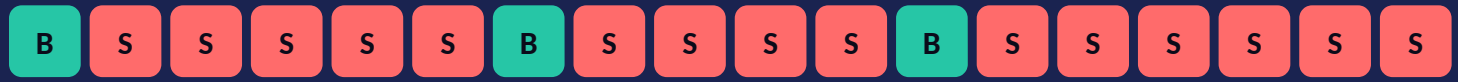

Sizes it can copy
Trade sizes you can follow without moving the price yourself.

Use a wallet tracker

Add the wallet to the Ray wallet tracker (RayBot on Telegram) to follow every buy and sell live, and keep its history.

Read their pattern on FOMO

Consistent: copy this

Open the trader on FOMO, then the Transactions tab. One or two buys, then six or seven sells: a ladder. They enter once and take profit in pieces. Clean patterns mean a calculated system.

Scattered: skip this

Random buys and sells: one in, one out, five in, two out. No pattern usually means no plan and no edge. That's gambling, not a system.

Check what they're holding right now

1

Open their holdings

On FOMO or a wallet tracker, see every coin they hold now.

2

Low market cap?

Coins still small, so there's room to grow.

3

Big share of supply?

They hold a real % of it, so they're committed.

4

Does the narrative fit?

An upcoming event or the current meta. It should make sense in one sentence.

5

All four: buy small

Same small size as always, and add it to your sheet.

Red flags: drop the wallet

- Most of its profit came from one coin
- Buys in the same block as the launch, every time (sniper or insider)
- Trades in a group: the same coins at the same second as other wallets (a bundle or cabal)
- Huge win rate on tiny trades, losses on big ones
- Dormant for weeks, then suddenly active
- Holds coins to zero instead of selling

When to stop following a wallet

1

Track it

Keep a sheet: every wallet you copy, the trades and the result.

2

Review weekly

Is it still profitable over its last 20 trades?

3

Cut losers

Three bad weeks in a row, or a big change in style: remove it.

4

Replace it

Find a new wallet from this week's best narrative.

08

Copy trading with a bot

Put the wallet into a copy-trading bot so you buy when they buy, within seconds.

Setting up the copy bot

1

Open the bot

Odin for Solana copy trading. Maestro for the other chains: Ethereum, Tron and more.

2

Make a bot wallet

Create a new wallet in the bot. Never import your vault.

3

Fund it small

Only what you're willing to lose.

4

Add the target

Paste the wallet address you vetted into copy trading.

5

Set your rules

Amount per trade, slippage, priority fee, sells (next slide).

The settings that matter

Fixed amount per copy
The same small amount on every trade, whatever the wallet buys. You're copying the idea, not their size.

Slippage and priority fee
High enough to get filled fast, low enough that you don't overpay on every trade.

Copy sells, or your own exits
Either sell when they sell, or use your own take-profit ladder (Lesson 10).

Protection settings
Anti-rug or MEV protection, a max buy price, a blacklist of coins you won't touch.

Starting settings

1–2%
of your portfolio per copy trade

15–25%
slippage on small, fast coins to start with

50% @ 3x
copy their buys, take your own exits

These are starting points. Lower the slippage and priority fee as you see what fills, and never raise the size to chase a loss.

LESSON 8

Copy trading: what goes wrong

You're last in

Even fast bots buy after the wallet does. On tiny coins that gap can be the whole move.

They exit, you don't

If you don't copy sells or use a ladder, you can hold after they've left.

The bot holds your key

A bot is a hot wallet. Keep its balance small and withdraw profits to your vault often.

09

Sizing

Small, fixed bets are what let you survive the coins that go to zero.

The sizing rules

1–2%
of your portfolio risked per trade

Max 10
open positions at once

Stop
for the day after a set loss

Your memecoin money is itself only a slice of what you have. The vault never funds it.

10

Taking profit on the way up

The money is made when you sell, not when the chart goes up.

A take-profit ladder

Buy

Under $20K market cap, 1–2% size.

3x

Sell 50%. Your risk is off the table.

Moon bag

The other 50% rides.

Full gain

Sell the moon bag into the crowd.

The profit rules

Half out at 3x
Once 50% is sold at 3x, the trade can no longer cost you money.

A time limit
If a coin does nothing for a set time, sell and move on.

No "it's going to 100x"
The plan is made before you buy. You follow it.

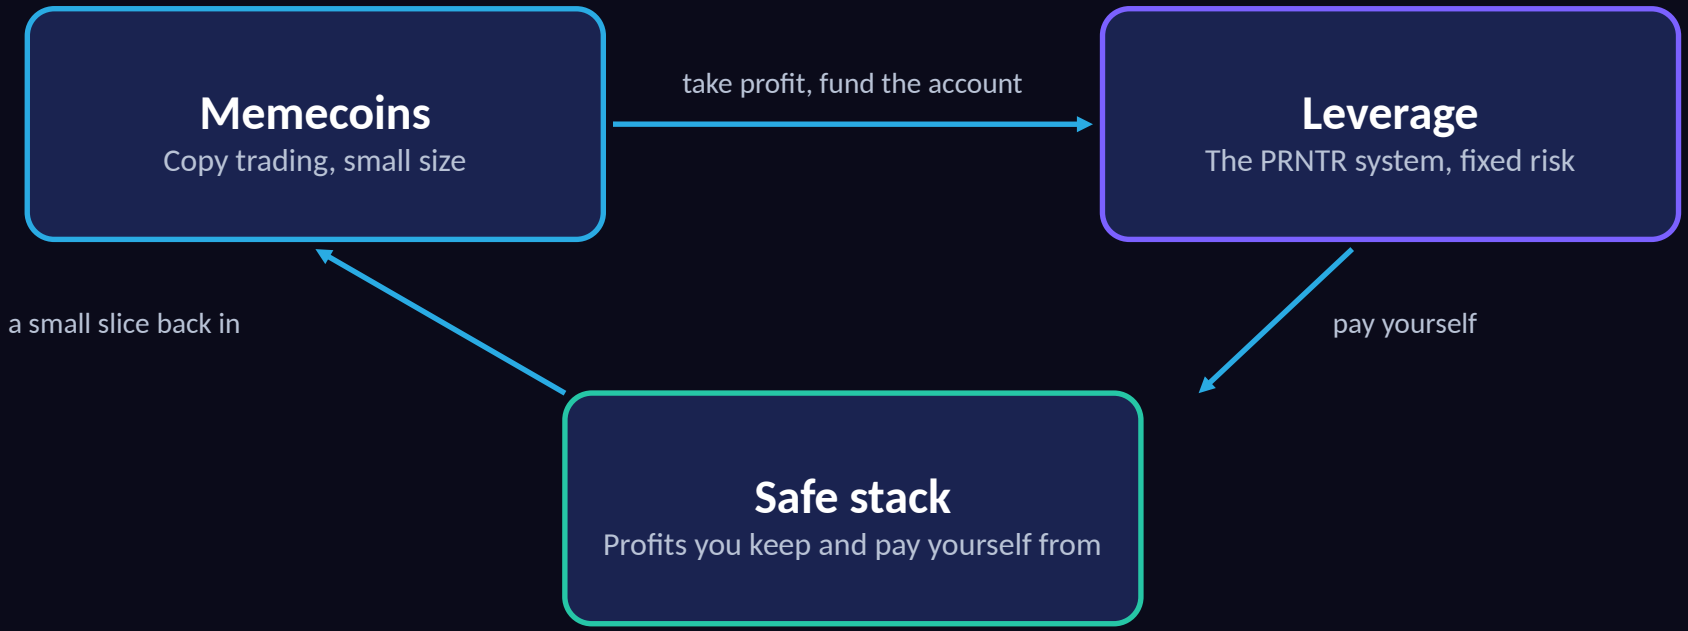

Profits leave the bot
Move profits to the vault or the next step of the loop, every week.

11

The money loop

How memecoin profits turn into leverage trading, a safe stack, and a monthly income.

Where the profit goes

LESSON 11

A split you can start with

50%
of memecoin profit to the safe stack

30%
to the leverage account

20%
stays for memecoins

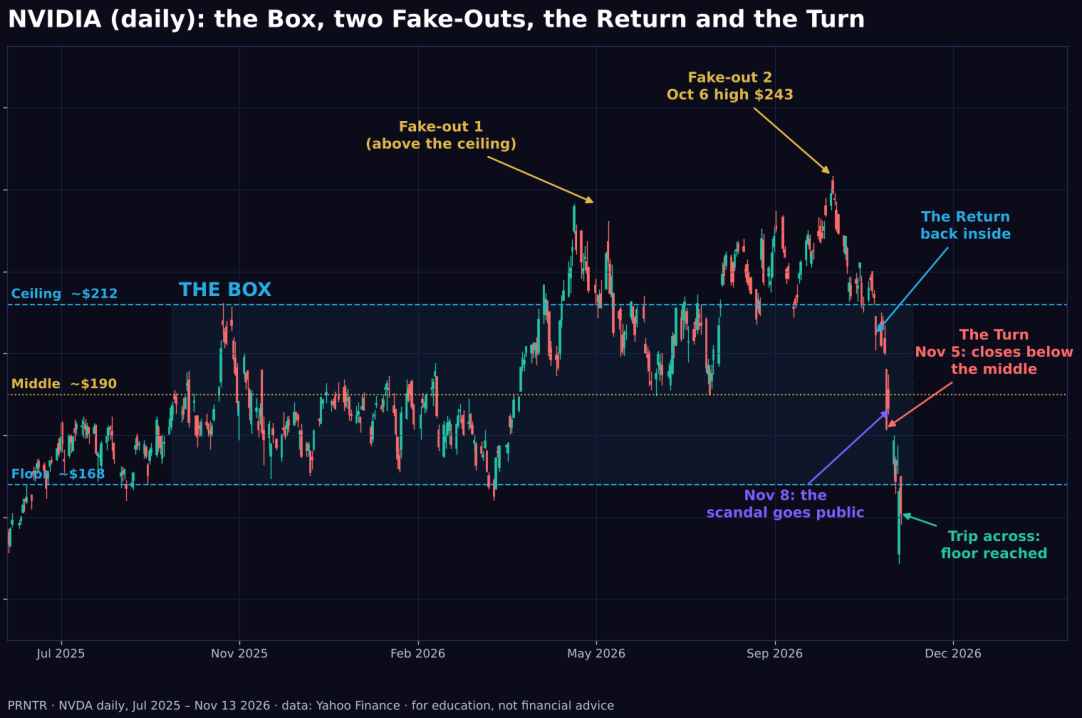

- Move funds to an exchange, never from the vault to a bot
- Pay yourself a fixed amount each month from the safe stack
- Never move money back in to win back a loss

12

Case study: NVIDIA × HUNG

The PRNTR Crossover: read a big stock's chart, then trade the memecoin wave its news creates.

The chart turned before the news

The Box
NVIDIA ranged between ~$168 and ~$212 for a year. Middle ~$190.

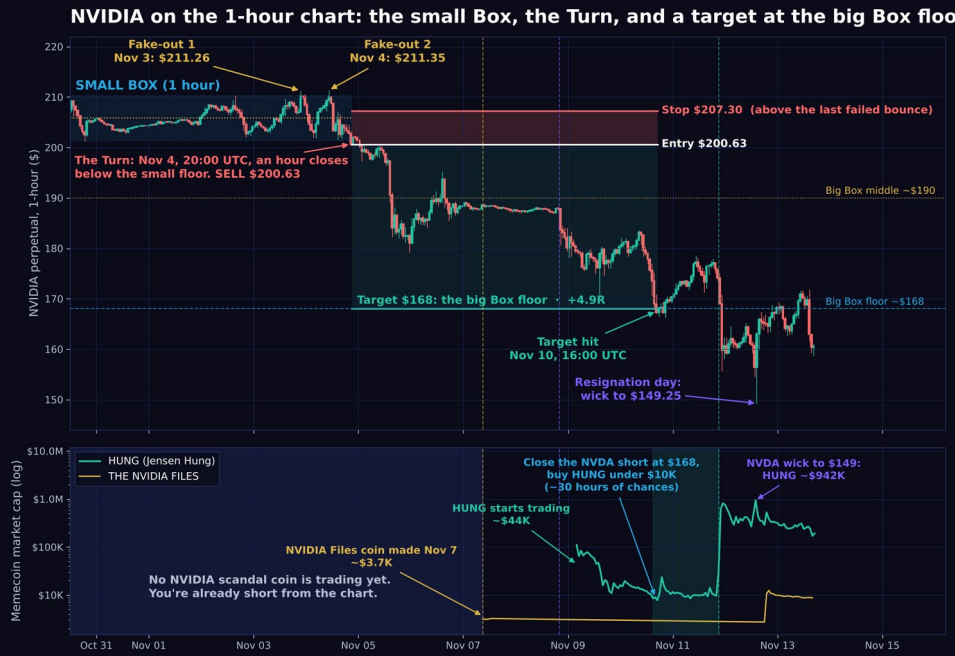

Two Fake-Outs
Above the ceiling in May and on Oct 6 ($243). Breakout buyers got trapped.

The Return and the Turn
Back inside by Oct 30. Nov 5 closed at $181.60, below the middle.

Then the news
The email to staff went public on Nov 8, three days after the Turn.

LESSON 12

Zoom in: the 1-hour Turn

PRNTR · NVIDIA: Bitunix NVDAUSDT 1-hour perpetual (trades 24/7) · coins: GeckoTerminal hourly, market cap = price × 1B supply · dashed lines: Nov 7 FT report, Nov 8 email, Nov 11 resignation news · times in UTC · a chart study, not a live signal · education only

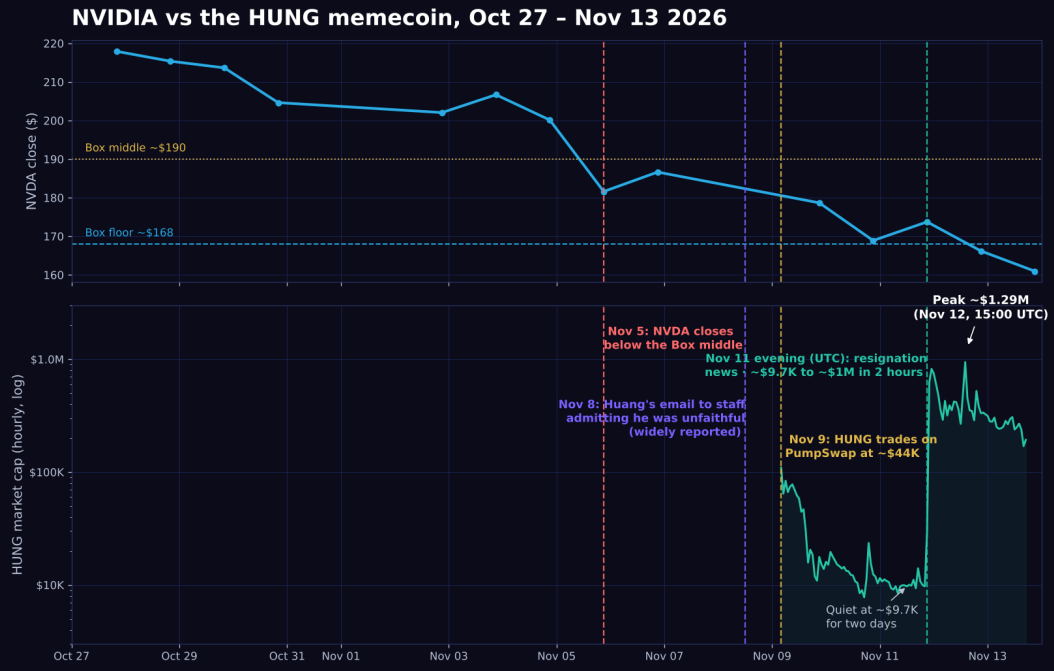

Small Box
Floor $201.32, ceiling $210.28, two Fake-Outs above it on Nov 3 and Nov 4.

Sell $200.63
Nov 4, 20:00 UTC: the first hour closes below the small floor.

Stop $207.30
Just above the last failed bounce. Highest price after entry: $202.25.

Target $168, +4.9R
The big Box floor. Hit Nov 10, 16:00 UTC.

The coin, on the same clock

PRNTR · NVDA: Yahoo Finance daily closes · HUNG (4xgqefa5...pump): GeckoTerminal hourly, PumpSwap pool, market cap = price × 1B supply · allegations are as reported by the press · education only

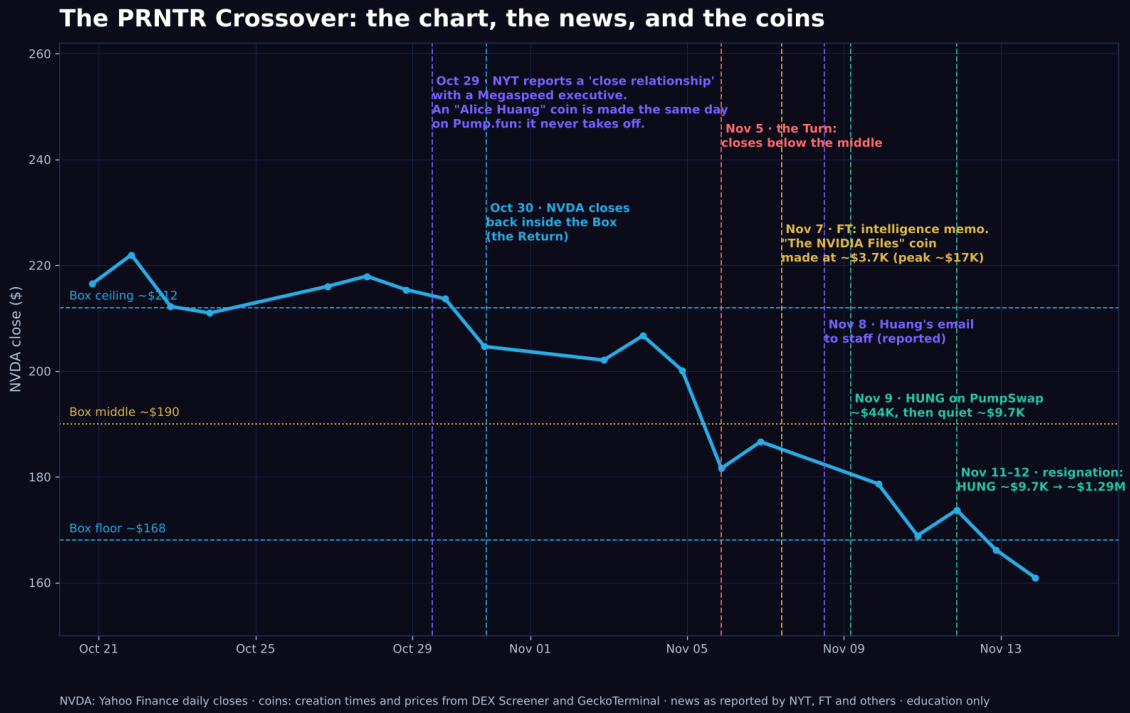

Nov 9
HUNG starts trading around $44K, then fades.

Nov 10–11
Quiet at ~$9.7K for two days. Most people gave up.

Nov 11, evening UTC
Resignation news: ~$9.7K to ~$1M in about two hours.

Nov 12
Peak ~$1.29M. Now ~$193K.

Could we have seen the news coming?

Oct 29
The NYT reports a 'close relationship' with a Megaspeed executive. An 'Alice Huang' coin appears the same day.

Nov 7
The FT reports an intelligence memo. 'The NVIDIA Files' coin is made at ~$3.7K.

Nov 8 → Nov 12
The email, more reports, the resignation.

The lesson
The story leaked in pieces for two weeks. Each piece was a chance to be early.

Catching the coins earlier

1

Watch the Turns

Keep a list of big names. When one makes its Turn, watch its news daily.

2

Alert on the names

Google Alerts and an X list: the CEO, nicknames, people and companies in the story.

3

Search the same hour

Every new name goes straight into Pump.fun and FOMO. Sort by oldest, check it's the OG.

4

Buy in the quiet

The cheapest entry is between headlines, when the coin has gone quiet.

5

Sell the 2nd headline

HUNG moved on the resignation, not the first story. Sell into that attention.

Both trades, one story, step by step

Time (UTC)	NVIDIA: the short	The coins
Nov 4, 20:00	The 1-hour Turn. Sell $200.63, stop $207.30, target $168.	None exist yet. Set alerts on every name in the story (Alice Huang, Megaspeed).
Nov 7, 09:00	In profit, around $188.	FT report. 'The NVIDIA Files' made at ~$3.7K. A few dollars at most (it peaked ~$17K).
Nov 8, 20:00	Email news: $187.88 to $180.67 in one hour.	Search Huang, Jensen, Hung on Pump.fun and FOMO.
Nov 9, 04:00	Around $179.	HUNG appears at ~$44K. Don't chase. Watch it.
Nov 10, 16:00	Target $168 hit. Close it: +4.9R.	HUNG is under $10K (low ~$7.8K). Buy with a slice of the profit.
Nov 11, 21:00	Done.	Resignation: ~$9.7K to ~$995K in two hours. Sell in pieces at $600K–$800K.

Example: $1,000 at 5x on the short makes about $813. Put $50 of it into HUNG at ~$9K (about 0.55% of the supply) and selling at $700K pays about $3,900. HUNG only traded $50–$160 an hour while it was quiet, so buy small or you'll move the price yourself.

The honest scorecard

Worked

The 1-hour Turn sold at $200.63, well before the news. HUNG went ~100x off its quiet price on the second headline.

Didn't

The Oct 29 'Alice Huang' coin died. 'The NVIDIA Files' only went from ~$3.7K to ~$17K. The first 'HUNG' from June went nowhere.

So

First isn't always the winner. Spread a few dollars across the story's coins, and size up only on the one getting real volume and holders.

SUMMARY

The 10 rules

1. Three wallets. The vault never touches a bot.
2. Scam-check every coin before you buy.
3. Get in before the crowd, sell into it.
4. Pick the narrative's leader, not the copies.
5. Copy wallets with a long record, not one big win.
6. Drop insider, sniper and bundled wallets.
7. Fixed small size on every copy.
8. Initials out at 2x, then a ladder.
9. Profits leave the bot every week.
10. Nothing goes back in to win back a loss.

Want help doing this live?

In the 1-on-1 mentorship we find narratives, vet wallets and set up your copy bot together, then connect it to the leverage system and the money loop.

prntr-ai.onrender.com/apply.html
